ABSTRACT

This article documents the public availability of genome sequence data and assembled contigs representing the partial draft genome of *Ophiocordyceps bispora*. As one of the few known pathogens of fungus-farming termites, a draft genome of *O. bispora* represents the opportunity to further the understanding of disease and resistance in these complex termite societies. With the ongoing attempts to resolve the taxonomy of the Hypocrales family, more genetic data will also help to shed light on the phylogenetic relationship between sexual and asexual life stages. Next generation sequence data is available from the European Nucleotide Archive (ENA) under accession PRJEB13655; run numbers: ERR1368522, ERR1368523, and ERR1368524. Genome assembly available from ENA under accession

Specifications Table

Subject area	Biology
More specific subject area	Mycology, Genomics
Type of data	Genomic sequence, gene prediction and phylogenetic placement of <i>Ophiocordyceps bispora</i>
How data was acquired	Shotgun whole-genome DNA sequencing using the Illumina HiSeq platform at The Danish National High-Throughput DNA Sequencing Centre
Data format	Raw sequencing reads, Draft genome assembly, gene prediction and phylogenetic analysis
Experimental factors	DNA was extracted from <i>Ophiocordyceps bispora</i> fruiting bodies protruding from the thorax of two <i>Macrotermes</i> spp. alates.
Experimental features	The Geneious ver. 8.0.5. read-mapping and assembly tool, which also takes read quality into account when mapping, were used to assemble the draft <i>O. bispora</i> genome. The genome of the closely related <i>Hirsutella thompsonii</i> MTCC 6686 [1] was used as reference genome. Sequences used for phylogeny construction were identified using blastn searches.
Data source location	Samples were collected in 1993 from two alates of <i>Macrotermes</i> sp. with <i>O. bispora</i> fruiting bodies growing out from the thorax. The specimens were found in a small cavity excavated underneath a rock in Isiolo and Kajiado, Kenya.
Data accessibility	European Nucleotide Archive (BioProject: PRJEB13655; Runs: ERR1368522, ERR1368523, and ERR1368524; Contigs: FKNF01000001–FKNF01000302) and Mendeley Data (http://dx.doi.org/10.17632/r99fd6g3s4.2 , http://dx.doi.org/10.17632/r99fd6g3s4.2).

Value of the data

- *Ophiocordyceps bispora* is the first pathogen of fungus-farming termites (Macrotermitinae) to have its genome sequenced.
- *O. bispora* represents one of the few known parasites of fungus-farming social insects.
- The *O. bispora* draft genome assembly will be of value for future comparative and phylogenetic analyses.
- Further study of *O. bispora*'s relationship with *Hirsutella thompsonii* could potentially identify a teleomorph–anamorph connection bringing the two species in line with the 2011 recommendations for The International Code of Nomenclature for algae, fungi and plants [2].

1. Data

We present a partial draft genome assembly with gene prediction of the fungus-farming termite pathogenic fungus *Ophiocordyceps bispora* (Ophiocordycipitaceae, Hypocreales). *O. bispora* infects the

Fig. 1. Phylogenetic placement of our specimen and closely related fungi in a concatenated nrSSU and nrLSU Bayesian phylogeny with posterior probabilities given at nodes. The sequenced specimen is highlighted in red while all other specimens are labelled with their herbarium numbers. A termite indicates that the fungus was reported from termites.

reproductive alate caste of several termite genera, including fungus-growing termites in the genus *Macrotermes* in Africa [3–7]. It is one of the few known pathogens of fungus-farming social insects and its *Macrotermes* host apparently has no other known diseases [8,9]. We also provide a two-gene phylogenetic analysis (Fig. 1) showing that *O. bispora* is closely related to an asexual form of *Ophiocordyceps*: *Hirsutella thompsonii*. The stark difference between sexual and asexual life stages in the Hypocreales family imply the different life stages of many species are classified twice [10]. Since 2011, the International Code of Nomenclature for algae, fungi and plants has been changed so that one fungus can have only one name [2]. Efforts to reconcile the taxonomy of the Hypocreales with these changes are ongoing [7,11,12], and the draft genome of *O. bispora* presented here may prove valuable in this effort.

2. Experimental design, materials and methods

2.1. Library

- Strategy: Shotgun whole-genome DNA sequencing.
- Taxon: *Ophiocordyceps bispora*.
- Sample details: Two alates of *Macrotermes* sp. with *O. bispora* fruiting bodies growing out from the thorax were collected from a small cavity excavated underneath a rock.
- Tissue: Fruiting body structures growing out from the dead, infected termite hosts.
- Location: Isiolo and Kajiado, Kenya.
- Sample handling: The sample was collected in 1993 by J. Eilenberg/G. Ochiel/H. Evans and preserved in ethanol at the Department of Plant and Environmental Sciences, University of Copenhagen.
- Selection: None.
- Layout: Single-end 100 bp reads.

2.2. Library construction protocol

Total fungal DNA was extracted from the fruiting bodies protruding from the termites by crushing and dissolving the sample in extraction buffer (10 mM Tris, 10 mM sodium chloride (NaCl), 5 mM calcium chloride (CaCl), 2.5 mM ethylenediaminetetraacetic acid (EDTA), 1% sodiumdodecyl sulfate (SDS), 10%

proteinase K and 6.17 mg/mL dithiothreitol (DTT)) overnight at 56 °C, followed by organic extraction of the DNA using one volume of chloroform. The DNA-containing supernatant was purified by mixing with 10 × volumes of modified PB buffer [13] and using a MinElute spin column (Qiagen) as demonstrated elsewhere [14]. The DNA was eluted in 60 µL EB buffer after a ten-minute incubation of the spin column with buffer at 37 °C and subsequently fragmented using a Diagenode Bioruptor with a program of 30 s on, 90 s off for 6 cycles. Illumina compatible shotgun sequencing library was generated using reagents from New England Biolabs kit for the 454, E#6070 L as described elsewhere [15]. The finished library was indexed and amplified for sequencing using 10 µL template and a mastermix consisting of 1 × AmpliTaq Gold buffer (Invitrogen), 2.5 mM MgCl₂ (Invitrogen), 0.8 µg/µL bovine serum albumin (BSA), 0.25 mM dNTP (Thermo Fischer Scientific, 25 mM stock), 0.2 µM forward and reverse indexed primer (10 µM stock), 0.2 U/µL AmpliTaq Gold enzyme (Invitrogen) and molecular grade water to a final reaction volume of 100 µL. The library was amplified in an Applied Biosystems 2720 Thermal Cycler, using the following conditions: 95 °C for 1 min, followed by a number of cycles of 95 °C for 30 sec, 60 °C for 30 s and 72 °C for 1 min for 5 cycles and finished by 7 min at 72 °C. Finally, the library was purified using a QiaQuick spin column (Qiagen), following manufacturer's instructions. The library was pooled with other samples and sequenced on 10% of a lane on an Illumina HiSeq 2500 instrument at The Danish National High-Throughput DNA Sequencing Centre, Copenhagen, Denmark.

2.3. Processing

Pipeline: DNA of the insect pathogenic fungus *O. bispora* was shotgun sequenced using Illumina HiSeq. Raw sequencing reads are available as three fastq files with accession nos. ERR1368522, ERR1368523, and ERR1368524.

- Run data file type: Fastq
- File Names (Runs: ERR1368522, ERR1368523, and ERR1368524, respectively):
 - TOG_QEHU_Term_fung_03_15_ACATAC_L004_R1_001.fastq.gz
 - TOG_QEHU_Term_fung_03_15_ACATAC_L004_R1_002.fastq.gz
 - TOG_QEHU_Term_fung_03_15_ACATAC_L004_R1_003.fastq.gz

The Geneious ver. 8.0.5. read-mapping and assembly tool, which also takes read quality into account when mapping, were used to assemble the draft *O. bispora* genome. The genome of the closely related *Hirsutella thompsonii* MTCC 6686 [1] was used as reference genome. The final assembled *O. bispora* draft genome consisted of 302 contigs and was 6,359,382 bp long. The maximum contig length, with a mean coverage of 3.1, was 158,451 bp with an N50 of 41,819 bp and a GC of 58.5%. Assembled contigs are available with accession nos. FKNF01000001–FKNF01000302. Protein coding sequences were predicted on both strands in the *O. bispora* draft genome using Augustus ver. 3.2.1 [16] using default parameters and found 3324 Open Reading Frames (ORFs).

The common fungal barcoding genes nuclear-ribosomal Large Sub-Unit (nrLSU) and nuclear ribosomal Small Sub-Unit (nrSSU) were located in the draft *O. bispora* genome assembly using blastn searches with Geneious 4.8.5. The identified *O. bispora* nrLSU and nrSSU sequences were combined with other Hypocreales sequences from GenBank (Table 1), and a concatenated alignment of nrSSU and nrLSU was produced using MUSCLE [17]. A Bayesian phylogenetic analysis was performed using Topali v2 (Runs: 2; Generations: 1,500,000; Burn in: 50%) [18].
