ADDENDUM TO: [JHEP11\(2015\)205](#)

ABSTRACT: This is an addendum to the article [JHEP 11 \(2015\) 205](#) [1]. The figures 3 (right), 4 (right) and 5 are updated with published results on non-prompt J/ψ -meson production from the CMS collaboration [2].

ARXIV EPRINT: [1506.06604](#)

In [1] the average nuclear modification factor R_{AA} of D^0 , D^+ and D^{*+} mesons in Pb–Pb collisions at $\sqrt{s_{NN}} = 2.76$ TeV measured by ALICE was compared with that of non-prompt J/ψ mesons from B-meson decays measured by the CMS collaboration using 2010 data ($7.28 \mu\text{b}^{-1}$) [3]. A higher-precision measurement based on 2011 data ($152 \mu\text{b}^{-1}$) was recently published by the CMS collaboration [2]. The measurement for the p_T interval 6.5–30 GeV/ c is carried out in three rapidity intervals, including $|y| < 1.2$, which is more similar to that of D mesons ($|y| < 0.5$).

Figure 1 shows the average of the D^0 , D^+ and D^{*+} nuclear modification factors as a function of centrality in $8 < p_T < 16$ GeV/ c , compared with the R_{AA} of non-prompt J/ψ mesons with $6.5 < p_T < 30$ GeV/ c [2]. The latter is significantly higher than that of the D mesons in the five centrality intervals from 0–10% to 40–50%. For example, the average difference of the R_{AA} values of D mesons and non-prompt J/ψ mesons in the 0–10% and 10–20% centrality classes is larger than zero with a significance of 3.4σ , obtained including the systematic uncertainties, and taking into account their correlation between

Figure 1. Comparison of the D meson R_{AA} (average of D^0 , D^+ and D^{*+}) in $8 < p_T < 16$ GeV/c [1] and of the R_{AA} of non-prompt J/ ψ mesons in $6.5 < p_T < 30$ GeV/c measured by the CMS collaboration [2]. The vertical bars represent the statistical uncertainties, while the filled (empty) boxes represent the systematic uncertainties that are correlated (uncorrelated) among centrality intervals. This figure updates figure 3 (right) of [1].

Figure 2. Comparison of the R_{AA} measurements with the calculations by Djordjevic et al. [4] including radiative and collisional energy loss. Lines of the same style enclose a band representing the theoretical uncertainty. For non-prompt J/ ψ mesons in $6.5 < p_T < 30$ GeV/c [2] the model results for the case in which the b quark interactions are calculated using the c quark mass are shown as well [7]. This figure updates figure 4 (right) of [1].

the two centrality classes. In figures 2 and 3 these measurements are compared with model calculations [4–6], as originally done in [1].

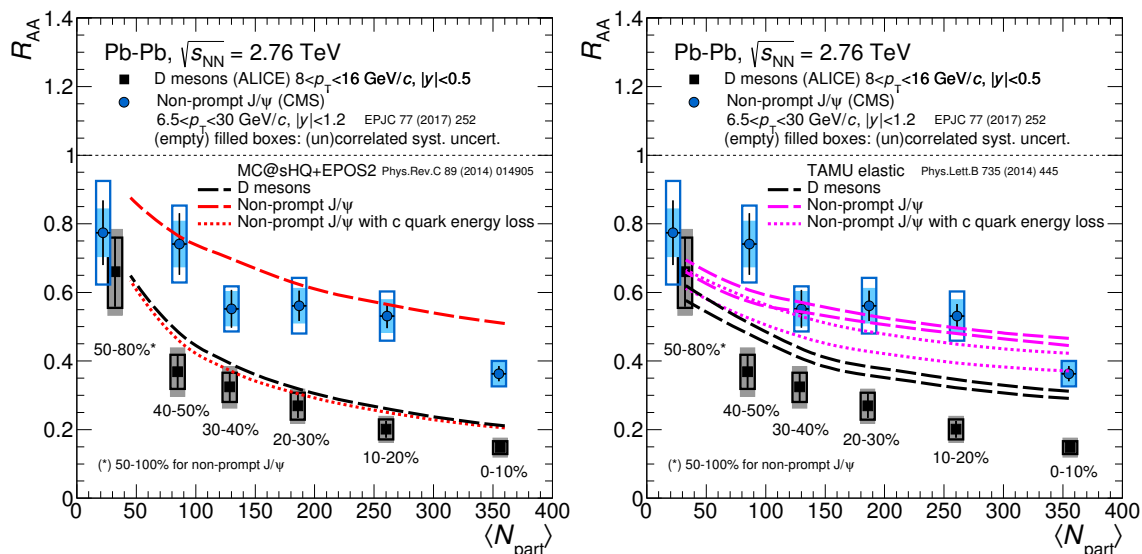

Figure 3. Comparison of the R_{AA} measurements with the $MC@sHQ+EPOS2$ model [5] including radiative and collisional interactions (left) and with the $TAMU$ elastic model [6] including collisional interactions via in-medium resonance formation. For both models, results for the case in which the b quark interactions are calculated using the c quark mass are shown as well [7]. In the right-hand panel, the band between lines with the same style represents the theoretical uncertainty. This figure updates figure 5 of [1].

The conclusions of the original publication [1] are confirmed by the comparisons that consider the new J/ψ -meson measurements. In particular, the comparison of the D-meson R_{AA} with the non-prompt J/ψ -meson R_{AA} shows a difference in the suppression of particles originating from c and b quarks in the most central collisions. This observation is described by theoretical calculations in which in-medium parton energy loss decreases with increasing quark mass.
