The equations of motion for the standard model effective field theory (SMEFT) differ from those in the standard model. Corrections due to local contact operators modify the equations of motion and impact matching results at sub-leading order in the operator expansion. As a consequence, a matching coefficient in $\mathcal{L}^{(\alpha)}$ (for operators of dimension $\alpha$) can be dependent on the basis choice for $\mathcal{L}^{(\alpha-c)}$. We report the SMEFT equations of motion with corrections due to $\mathcal{L}^{(5,6)}$. We demonstrate the effect of these corrections when matching to sub-leading order by considering the interpretation of recently reported $B \rightarrow K^{(*)} \ell^+ \ell^-$ lepton universality anomalies in the SMEFT.

I. INTRODUCTION

When physics beyond the standard model (SM) is present at scales $\Lambda > \sqrt{2 (H^2 H)} = \tilde{v}_F$, the SM can be extended into an effective field theory (EFT). Such an EFT can be constructed with two further defining assumptions: no light hidden states in the spectrum with couplings to the SM; and a SU(2)$_L$ scalar doublet with hypercharge $Y_h = 1/2$ being present in the EFT. The resulting standard model effective field theory (SMEFT) extends the SM with higher dimensional operators $Q_{i(d)}$ of mass dimension $d$:

$$\mathcal{L}_{\text{SMEFT}} = \mathcal{L}_{\text{SM}} + \mathcal{L}^{(5)} + \mathcal{L}^{(6)} + \mathcal{L}^{(7)} + \ldots,$$

$$\mathcal{L}^{(d)} = \sum_i \frac{C_{i(d)}^{(d)}}{\Lambda^{d-4}} Q_{i(d)}^{(d)} \quad \text{for } d > 4. \quad (1)$$

The operators $Q_{i(d)}^{(d)}$ are suppressed by $d-4$ powers of the cutoff scale $\Lambda$ and the $C_{i(d)}^{(d)}$ are the Wilson coefficients. We use the nonredundant $\mathcal{L}^{(6)}$ Warsaw basis [1], which removed some redundancies (see also [2]) in the overcomplete basis of Ref. [3].

The exact size of the SMEFT expansion parameters: $\tilde{v}_F^2/\Lambda^2 < 1$, $p^2/\Lambda^2 < 1$ ($p^2$ stands for a general dimension two kinematic Lorentz invariant, $\tilde{v}_F^2$ is the modified Higgs potential$^1$), are unknown and modified by the $C_{i(d)}^{(d)}$. As a result when deviations from the SM are interpreted in the SMEFT formalism, subleading results and loop corrections are sometimes of interest in interpreting an experimental result.

To perform a matching to a nonredundant operator basis for $\mathcal{L}^{(d)}$, it is usually required to know the equations of motion (EOM), including possible SMEFT corrections due to $\mathcal{L}^{(\alpha-c)}$. In this paper, we report the EOM for the SMEFT including corrections due to $\mathcal{L}^{(5,6)}$ and demonstrate the utility of these results in some examples.

A partial discussion concerning corrections of this form has recently appeared in literature in Refs. [5,6]. Reference [5] discusses EOM corrections to matching results of the seesaw model to subleading order, while Ref. [6] discusses the importance of these corrections to matching between the SMEFT and the low-energy EFT where some standard model particles are integrated out.

II. NOTATION AND CONVENTIONS

The SM Lagrangian [7–9] notation is fixed to be

$$\mathcal{L}_{\text{SM}} = -\frac{1}{4} G_{\mu\nu}^{A} G^{A\mu\nu} - \frac{1}{4} W^{\mu}_{\nu} W^{\mu\nu} - \frac{1}{4} B_{\mu\nu} B^{\mu\nu},$$

$$+ \sum_{\psi} \bar{\psi} i D\psi + (D_{\mu} H) (D^{\mu} H) - \lambda \left( H^2 H - \frac{1}{2} v^2 \right)^2$$

$$- [H^{ij} \bar{\psi} Y_d q_j + \bar{H}^{ij} \tilde{\psi} Y_u a_j + H^{ij} \bar{\psi} \ell_j + \text{H.c.}], \quad (2)$$

where $\psi = \{ q, \ell, u, d, e \}$ are four component Dirac spinors that transform as $\{ 2, 2, 1, 1, 1 \}$ under SU(2)$_L$. The fermion fields $q$ and $\ell$ are left-handed fields and transform as $(1/2, 0)$ under the restricted Lorentz group SO$^+(3,1)$. The $u, d$ and $e$ are right-handed fields and transform as $(0, 1/2)$.

$^1$In the SMEFT, the Higgs scalar doublet potential is modified by the inclusion of the operator $Q_H = (H^2 H)^3$ yielding a new minimum $\langle H^2 H \rangle$ yielding a new minimum $\langle H^2 H \rangle$ yielding a new minimum$^1$ yield
chiral projectors have the convention $\psi_{L/R} = P_{L/R}\psi$ where $P_{R/L} = (1 \pm i \gamma_5)/2$. The gauge covariant derivative is defined with a positive sign convention $D_\mu = \partial_\mu + ig_3 T^A A^A_\mu + ig_s t^a W^a_\mu + ig_1 y_1 B_\mu$. $y_1$ is the $U_Y(1)$ hypercharge generator. The SU(3) generators ($T^A$) are defined with normalization $\text{Tr}(T^A T^B) = 2 \delta^{AB}$ and finally $t^l = t^l/2$ are the SU(2) generators, with $t^l$ the Pauli matrices. $\hat{H}_i = e_{jk} H^{*k}$ where the SU$_L(2)$ invariant tensor $e_{jk}$ is defined by $\epsilon_{12} = 1$ and $\epsilon_{jk} = -\epsilon_{kj}$. At times we raise or lower this index in notation for clarity on index sums. The flavor indices are suppressed in Eq. (2), the fermion mass matrices are defined in the Appendix. The leading correction to the SM violates Lepton number due to its operator dimension $[11,12]$. We use the leading correction to the SM violates Lepton number due to its operator dimension $[11,12]$. We use

$$L_{\text{SMEFT}} = \sum_{m<n} O_{mn} \epsilon^m \epsilon^n,$$

with spinor conventions defined as follows. The $c$ superscript corresponds to a charge conjugated Dirac four-component spinor $\psi^c = C \psi^T$ with $C = -i \gamma_2 \gamma_0$ in the chiral basis for the $\gamma_i$ we use. The star superscript is reserved for complex conjugation operation that is applied to bosonic quantities. As chiral projection and $c$ do not commute we fix notation that $\epsilon^c$ denotes a doublet lepton field chirally projected and subsequently charge conjugated.

### III. FORMALISM FOR EOM TO SUBLEADING ORDER

The SMEFT Lagrangian is composed of a series of $d$ dimensional operators in $L^d$. Counting the independent operators in a non-redundant operator basis for $L^d$ can be performed efficiently using the results of Refs. [15–18]. Reducing a basis to a nonredundant form using the EOM is related to the possibility to perform gauge independent field redefinitions that satisfy the equivalence theorem of S-matrix elements [19–22]. The full set of all possible $SU(3)_c \times SU(2)_L \times U(1)_Y$ preserving small field redefinitions on the SM fields, collectively denoted $\mathcal{F}$, up to order $d$, can be denoted

$$\mathcal{F} \rightarrow \mathcal{F}' + \sum_{i=1}^d c_i \left( \frac{O_i}{N} \right),$$

with $O_i$, $\mathcal{F}'$ both transforming as $\mathcal{F}$ under $SU(3)_c \times SU(2)_L \times U(1)_Y$ and subject to $\text{dim}[\mathcal{F}] = \text{dim}[O_i] - \text{dim}[\mathcal{F}']$. Redefining the field variables with a specific sequence of the full set of $\mathcal{F}$ transformations, a nonredundant basis can be defined by choosing $c_i$ to cancel the largest set of operators possible in an overcomplete basis. For a more thorough discussion on field redefinitions and the removal of redundant operators, see Ref. [10]. Consistency conditions result from this procedure. Some of these conditions are the EOM relations between operators of different bases. Another consequence is that the higher dimensional operators play a role in the renormalization group evolution of the Lagrangian parameters of dimension $d \leq 4$. For the Warsaw basis, the RG running results of this form were reported in Ref. [23]. In this paper we address another set of consistency conditions, the modifications of the EOM in a particular operator basis. Once $L_{\text{SMEFT}}$ is defined up to dimension $(n)$, when considering matching up to this canonical dimension, the higher dimensional operators themselves correct the SM EOM due to operators of dimension $m < n$. This results in matching results at dimension $(n)$ having a subtle dependence on basis choice at order $m < n$. This effect comes about as the field variables themselves are redefined in the EFT when defining a nonredundant operator basis.

The EOM for the SMEFT, as in the SM, are defined by the condition that the variation of the action with respect to the fields vanishes ($\delta S = 0$), where

$$S = \int \mathcal{L}_{\text{SMEFT}}(\mathcal{F}, D_\mu \mathcal{F}) d^4x,$$

resulting in

$$0 = \int d^4x \left[ \frac{\partial \mathcal{L}_{\text{SMEFT}}}{\partial \mathcal{F}} \delta \mathcal{F} - \partial_\mu \left( \frac{\partial \mathcal{L}_{\text{SMEFT}}}{\partial (\partial_\mu \mathcal{F})} \right) \delta \mathcal{F} \right],$$

where the surface term given by

$$\partial_\mu \left( \frac{\partial \mathcal{L}_{\text{SMEFT}}}{\partial (\partial_\mu \mathcal{F})} \right),$$

vanishes. The surface term vanishes up to an accuracy dictated by the power counting of the SMEFT to order $(d)$, as this is the accuracy to which the field variables are defined. The surface term and variation are defined by a partial derivative. At low orders in the operator dimension expansion of $L_{\text{SMEFT}}$ the EOM terms are simplified into a form with covariant derivatives in the adjoint and fundamental representations due to renormalizability. This simplification is present in the SM EOM, but is not present in the SMEFT EOM corrections in some cases, as shown below.

### IV. SMEFT EOM

We use the Hermitian derivative conventions and integration by parts identity

---

2At $L^5$ only $Q_{lm}^5$ (and its Hermitian conjugate) are present. It is interesting to note that, equivalently, for $\text{dim}[\mathcal{N}] = 1$, no factorization of $O_i$ is possible into a field variable transforming as $F$ while $O_i/F$ is composed of dynamical (SMEFT symmetry preserving) fields.
\[ H^\dagger iD^\mu H = iH^\dagger(D^\mu H) - i(D^\mu H)^\dagger H, \quad (8) \]
\[ H^\dagger iD^\mu H = iH^\dagger(D^\mu H) - i(D^\mu H)^\dagger H, \quad (9) \]
\[ \bar{Q}_{HC} + 4Q_{HD} = (H^\dagger iD^\mu H)(H^\dagger iD^\mu H). \quad (10) \]

The currents of the SM fields are defined as
\[ j^A_{\mu} = \sum_{\psi=\nu,d,q} \bar{\psi} T^A \gamma_{\mu} \psi, \quad (11) \]
\[ j^q_{\mu} = \frac{1}{2} \bar{q} \gamma^\mu q + \frac{1}{2} \bar{\tau} \gamma^\mu \tau + \frac{1}{2} H^\dagger iD^\mu H, \quad (12) \]
\[ j^u_{\mu} = \sum_{\psi=\nu,d,q} \bar{\psi} T^A \gamma_{\mu} \psi + \frac{1}{2} H^\dagger iD^\mu H. \quad (13) \]

Corrections to the SM EOM gauge fields are
\[ [D^\mu, G_{\mu\nu}]^A = g_3 j^A_{\nu} + g_3 \sum_{d=3}^{\infty} \frac{\Delta_{G,d}^A}{\Lambda^{d-4}}, \]
\[ [D^\mu, W_{\mu\nu}]^j = g_2 j^j_{\nu} + 2g_2 \sum_{d=3}^{\infty} \frac{\Delta_{W,d}^j}{\Lambda^{d-4}}, \]
\[ D^\mu B_{\mu\nu} = g_1 j^j_{\nu} + g_1 \sum_{d=3}^{\infty} \frac{\Delta_{B,d}^j}{\Lambda^{d-4}}. \quad (14) \]

\[ \Delta^{(6)} \] contains the full set of corrections to each field's EOM, due to the complete Warsaw basis of \( \Delta^{(6)} \) operators. These corrections are reported in the Appendix.

The covariant derivatives for an operator \( Q \) in the adjoint representations of SU(2) and SU(3) are
\[ [D^\mu, Q]^1 = \partial^\mu Q^1 - g_2 e^{JK} W^j_J Q_K, \quad (15) \]
\[ [D^\mu, Q]^3 = \partial^\mu Q^3 - g_3 \epsilon^{ABC} A^\mu_B Q_C. \quad (16) \]

Corrections to the SM EOM for the fermions are of the form (color indices are suppressed)
\[ iD^\mu q^j_m = u^a [Y_\mu_{nm}^j \bar{H}^\mu] + d^a [Y_\mu_{nm}^j \bar{H}^\mu] + \sum_{d=3}^{\infty} \frac{\Delta_{j,m}^{(d)}}{\Lambda^{d-4}}, \]
\[ iD^\mu \bar{e}^j_m = [Y_{e,m}]_j \bar{e}^\mu + \sum_{d=3}^{\infty} \frac{\Delta_{j,m}^{(d)}}{\Lambda^{d-4}}, \]
\[ iD^\mu d^m = [Y_{d,m}]_q \bar{q}^\mu H^j + \sum_{d=3}^{\infty} \frac{\Delta_{d,m}^{(d)}}{\Lambda^{d-4}}, \]
\[ iD^\mu u^m = [Y_{u,m}]_q \bar{q}^\mu H^j + \sum_{d=3}^{\infty} \frac{\Delta_{d,m}^{(d)}}{\Lambda^{d-4}}, \]
\[ iD^\mu e_m = [Y_{e,m}]_q \bar{q}^\mu H^j + \sum_{d=3}^{\infty} \frac{\Delta_{d,m}^{(d)}}{\Lambda^{d-4}}. \quad (17) \]

The corrections for \( \mathcal{L}^{(5)} \) using Eqn. (3) are
\[ \Delta_{j,m}^{(5)} = -2C_{nm}^{(5)} \bar{H}^\mu (\bar{H}^\mu)^{e,m}, \quad (19) \]
\[ \Delta_{j,m}^{(5)} = -C_{nm}^{(5)} [e_{j}^{n} \bar{H}^\mu (\bar{H}^\mu)^{e,m} + \sum_{d=3}^{\infty} \Delta_{j,m}^{(d)} \frac{\Delta_{j,m}^{(d)}}{\Lambda^{d-4}}. \quad (20) \]

V. MATCHING EXAMPLES

As an illustrative set of examples of matching using the SMEFT EOM, we consider the interpretation of anomalous measurements of \( B \to K^{(*)} \tau^+ \tau^- \) lepton universality ratios for \( \tau_{m=1,2} \) \( \{e, \mu\} \) \( [24,25] \) which have shown some minor tension with the SM predictions. Such anomalies could signal physics beyond the SM \( \text{SM}^3 \) that induce the \( \mathcal{L}^{(6)} \) operators
\[ Q_{(\mu \nu)_{\text{anom}}}^{(1)} = (\bar{\tau}_{\mu} \gamma_{\nu} \tau_{\nu} b), \quad (21) \]
\[ Q_{(\mu \nu)_{\text{anom}}}^{(3)} = (\bar{\tau}_{\mu} \gamma_{\nu} \tau_{\nu} b). \quad (22) \]

The operators and anomalies of interest can come about by matching at tree level to \( \mathcal{L}^{(6)} \) the effect of fields denoted as \( \{e, \mu, \nu, U_2, \chi\} \) (using the notation of Ref. [26]), for example. These fields have the \{SU(3), SU(2)\} \( \mathcal{U}_{\nu_{(1)}} \)

3These anomalies could also be statistical fluctuations, as indicated by their global (in)significance. Here our interest in these anomalies only extends to an illustrative example of EOM SMEFT effects.
representations, with the spin of each field given as a superscript

\[
\{(3,3)^{0}_{-1/3}, (1,1)^{0}_{0}, (1,3)^{0}_{1}, (3,1)^{1/2}_{2/3}, (3,3)^{1/2}_{2/3}\}. \tag{23}
\]

The field \(\zeta\) leads to the baryon number violating operator \(Q_{qq\zeta}\), indicating a very small matching coefficient. In addition, the operators \(Q^{(1,3)}_{q\zeta}, Q^{(1,3)}_{\zeta q}\) are also induced in a tree level matching. Since \(\zeta\) is a scalar field, the low-momentum expansion of a scalar propagator introduces a dependence on the momentum \(p\) flowing through the scalar propagator at subleading order—i.e., \(p^2/m^2_{\zeta}\), which can be reduced using EOM. The first irreducible corrections appear only at \(\mathcal{L}^{(10)}\).

The heavy vector fields \(\{\beta, W\}\) are more interesting when considering EOM corrections in \(\mathcal{L}^{(8)}_{\text{SMEFT}}\). Consider the singlet field \(\beta\), with a bare mass introduced via the Stueckelberg mechanism \([27]\), as encoded in a Proca propagator at subleading order—i.e., \(p^2/m^2_{\beta}\), which can be reduced using EOM. The first irreducible corrections appear only at \(\mathcal{L}^{(10)}\).

In addition, the following products of currents are also reduced with the EOM

\[
\mathcal{L}^{(6)}_{\beta} \supset \frac{1}{m^2_{\beta}} \bar{g}_R^{RH} g_L^{HH} H^\dagger i\not\!D_\mu H \partial^\mu (H^\dagger H), \tag{27}
\]

This generates the Wilson coefficients

\[
C_{(\mp \beta)} = \frac{3}{4} \frac{g_L^{RH}}{m^2_{\beta}} [\bar{Y}^\dagger L]_r m_{g_R \gamma} \frac{g_L^{HH}}{m^2_{\beta}} \not\!\partial_\mu (H^\dagger H) \sum_{\rho = (\gamma,e,d,u)} g^\rho_m \bar{\psi}_m \gamma^\rho \psi_n.
\]

These matching results have been verified against the comprehensive tree-level matching dictionary given in Ref. \([26]\).

4Of course, other effects at subleading order also exist, including the expansion of the matrix elements in the power counting.
Definition of \( J_{\nu r,\mu} \) is given by (A1) in the Appendix. The scaling of these matching contributions with couplings to \( \beta \) is also nonintuitive. A directly constructed Feynman diagram with this coupling scaling involves two intermediate \( \beta \) fields and an internal propagator of the light states retained in the SMEFT, as shown in Fig. 2. The light intermediate state propagator leads to the lack of a local operator in the low momentum limit defining the SMEFT. Corrections with this coupling dependence are nevertheless still present as local contact operators in the SMEFT. We have illustrated these effects in some simple examples using the Warsaw basis. As such, such cancellations do not occur as the derivative terms reduced with the EOM in defining the Warsaw basis act on bi-linear currents with the same fermion field. As the \( B \) meson anomalies are similar, the normalization differ by a factor of 4.

The EOM effects at subleading order due to the heavy fields and an internal propagator of the light states retained in the SMEFT, as shown in Fig. 2. The light intermediate state propagator leads to the lack of a local operator in the low momentum limit defining the SMEFT. Corrections with this coupling dependence are nevertheless still present as local contact operators in the SMEFT, they come about due to the contributions illustrated in Fig. 1.

The presence of an explicit factor of \( i \) in Eq. (29) indicates that the decomposition of the Wilson coefficient of the operator into real and imaginary components leads to the cancellation of some terms symmetric in the flavor indices. Recall that the flavor indices that are bilinear in the same field of a self Hermitian operator can be decomposed into a real symmetric \( S_{\nu r} \) (**CP-even**) and real anti-symmetric \( A_{\nu r} \) (**CP-odd**) dependence as

\[
C_{\nu r} = S_{\nu r} + iA_{\nu r},
\]

The antisymmetric components of the Hermitian operator’s Wilson coefficient do not cancel in the case considered, but the symmetric components do cancel. Such cancellations occur as the derivative terms reduced with the EOM in defining the Warsaw basis act on bi-linear currents with the same fermion field. As the \( B \) meson anomalies are associated with flavor diagonal lepton interactions, but off-diagonal quark flavor indices, the second term in Eq. (29) survives for case of the \( \beta \) field leading to these anomalies with a \( CP \)-odd phase. This effect comes about directly when the \( \beta \) field is promoted to a complex singlet vector field.

The EOM effects at subleading order due to the heavy field \( \mathcal{W} \) are similar. The interaction Lagrangian with the SM fields is then

\[
2\mathcal{L}_{\text{int}}^W = -g_{\mathcal{W}}^R \mathcal{W}^\mu_R \mathcal{W}^\rho_R H^\tau \tau^\tau \rho + g_{\mathcal{W}}^\rho \mathcal{W}^\rho_R \mathcal{W}^\mu_R \partial_\mu (H^\tau \tau^\tau),
\]

leading to the contact operators

\[
\mathcal{L}_{\mathcal{W}}^{(6)} = \frac{1}{4m_{\mathcal{W}}^2} g_{\mathcal{W}}^R g_{\mathcal{W}}^R (H^\tau \tau^\tau \rho) \partial_\rho (H^\tau \tau^\tau),
\]

\[
+ \frac{g_{\mathcal{W}}^R}{4m_{\mathcal{W}}^2} \partial_\rho (H^\tau \tau^\tau) \sum_{\omega = \{\bar{c},q\}} g_{\mathcal{W}}^\omega \bar{\psi}_m \gamma_\mu \psi_n.
\]

This results in corrections to \( \mathcal{L}_{\mathcal{W}}^{(8)} \) due to the field \( \mathcal{W} \), which include the operator in Eqs. (22). The matching is analogous to the form in Eq. (29) with the operators \( Q_{\nu \ell q} \) replacing the operators \( Q_{\nu \ell q} \). In addition, the normalization differs by a factor of 4.

The fermion fields \( \{U_2, \chi\} \) do not lead to an EOM reduction in \( \mathcal{L}_{\mathcal{W}}^{(6)} \) when using the Warsaw basis. As such, they do not induce nonintuitive corrections through the EOM of this form. This result is due to the particular representations that these fermion fields carry and is not general. For example, integrating out a singlet fermion field in Ref. [5] leads to subleading corrections at \( \mathcal{L}_{\mathcal{W}}^{(7)} \) due to EOM reductions of \( \mathcal{L}_{\mathcal{W}}^{(6)} \) when considering the matching of the minimal seesaw model to \( \mathcal{L}_{\text{SMEFT}} \).

**VI. CONCLUSIONS**

In this paper we have determined the corrections due to \( \mathcal{L}_{\mathcal{W}}^{(5)} \) and \( \mathcal{L}_{\mathcal{W}}^{(6)} \) to the SMEFT equations of motion. These corrections introduce a dependence on the operator basis defined at dimension \( \mathcal{L}_{\mathcal{W}}^{(6)} \) when matching to \( \mathcal{L}_{\mathcal{W}}^{(7)} \), or higher orders. Incorporating EOM corrections can be essential to correctly determine matching to sub-leading order in the SMEFT. We have illustrated these effects in some simple matching examples using the \( B \) meson anomalies as motivation.

EQUATIONS OF MOTION FOR THE STANDARD MODEL ...
We use the notation

\[ J_{pr}^{\alpha\mu} = \bar{\psi}_p \gamma^\mu \psi_r, \quad J_{pr}^{\alpha I} = \bar{\psi}_p \gamma^\mu \gamma^I \psi_r, \quad J_{pr}^{\alpha A} = \bar{\psi}_p \gamma^\mu T^A \psi_r, \]

\[ C_{\rho \mu \nu}^{\alpha \beta} = C_{\rho \mu \nu}^{\alpha \beta} + C_{\rho \mu \nu}^{\alpha \beta} = C_{\rho \mu \nu}^{\alpha \beta} + C_{\rho \mu \nu}^{\alpha \beta} \]

(A1)

with \((g, G) = \{(g, I), (I, t', (A, T^A)\})\) for more compact expressions. Throughout the paper, we use the following convention for the subscripts to denote quantum numbers. SU(3) indices are \(\{a, b, \beta, \rho\}\) and the corresponding generator indices are \(\{A, B, C, D, E\}\). The SU(2) indices are represented by \(\{i, j, k, l, \alpha\}\) and its generator indices by \(\{I, J, K, R, S\}\). The Lorentz indices are represented by the Greek letters \(\{\mu, \nu, \gamma, \phi\}\) and lastly the flavor (fermion family) indices are denoted by \(\{p, r, s, t, m, n\}\). The corrections due to \(\mathcal{L}^{(6)}\) in the “Warsaw” basis for the Higgs EOM are

\[ \Delta_{H}^{\mathcal{L}^{(6)}} = 3C_H(H^2 H)^2 H^I + \sum_{F=W, B, G} \left( C_{HF} H^I F_{\mu
u} + C_{HF} H^I \tilde{F}_{\mu
u} + \right) \sum_{F=W, B, G} C_{HF B} (t_1 H^I) F_{\mu
u} B^{\alpha\beta}, \]

\[ + C_{(\rho \mu \nu)}^{(\alpha \beta)} H^{I} [\tilde{\psi}_p g^\mu - C_{(\rho \mu \nu)}^{(\alpha \beta)} H^{I} \tilde{\psi}_p u^\mu] H^I - C_{(\rho \mu \nu)}^{(\alpha \beta)} H^{I} \tilde{\psi}_p u^\mu H^I - C_{(\rho \mu \nu)}^{(\alpha \beta)} H^{I} \tilde{\psi}_p u^\mu - C_{(\rho \mu \nu)}^{(\alpha \beta)} H^{I} \tilde{\psi}_p u^\mu, \]

(A2)

The corrections to the fermion due to the B number conserving \(\mathcal{L}^{(6)}\) operators are

\[ \Delta_{\mathcal{L}^{(6)}}^{(6,B)} = \left( -C_{\rho \mu \nu}^{(\alpha \beta)} (H^I H)^H t_\rho \ell_\mu - C_{\rho \mu \nu}^{(\alpha \beta)} (H^I H) \tilde{t}_\rho \ell_\mu \right) p^\rho e_p - C_{\rho \mu \nu}^{(\alpha \beta)} (H^I H) t_\rho \ell_\mu p^\rho W_{\mu \nu} - C_{\rho \mu \nu}^{(\alpha \beta)} (H^I H) \tilde{t}_\rho \ell_\mu p^\rho W_{\mu \nu}, \]

(A3)

\[ \Delta_{\mathcal{L}^{(6)}}^{(6,B)} = \left( -C_{\rho \mu \nu}^{(\alpha \beta)} (H^I H) q_p - C_{\rho \mu \nu}^{(\alpha \beta)} (H^I H) \tilde{t}_\rho \ell_\mu p^\rho \right) p^\rho d_p + \left( -C_{\rho \mu \nu}^{(\alpha \beta)} (H^I H) \tilde{t}_\rho \ell_\mu p^\rho \right) p^\rho d_p, \]

(A4)

\[ \Delta_{\mathcal{L}^{(6)}}^{(6,B)} = \left( -C_{\rho \mu \nu}^{(\alpha \beta)} (H^I H) q_p - C_{\rho \mu \nu}^{(\alpha \beta)} (H^I H) \tilde{t}_\rho \ell_\mu p^\rho \right) p^\rho d_p + \left( -C_{\rho \mu \nu}^{(\alpha \beta)} (H^I H) \tilde{t}_\rho \ell_\mu p^\rho \right) p^\rho d_p, \]

(A5)
\[ \Delta_{\mu,(6)} = -C_{\mu,(6)}^{\mu}(H^\dagger H)\bar{H}\gamma_\mu p - C_{\mu,(6)}^{\mu}(H^\dagger i\Sigma_\mu H)\gamma_\mu u - C_{\mu,(6)}^{\mu}(H^\dagger D_\mu H)\gamma_\mu d - C_{\mu,(6)}^{\mu}\beta_{\mu ppm} \bar{H} \gamma_\mu q \bar{W}_\mu, \]
\[ - C_{\mu,(6)}^{\beta}(H^\dagger H)\bar{H}\gamma_\beta p B - C_{\mu,(6)}^{\beta}(H^\dagger i\Sigma_\beta H)\gamma_\mu q G - C_{\mu,(6)}^{\beta}(H^\dagger D_\beta H)\gamma_\mu u - C_{\mu,(6)}^{\beta}\beta_{\mu ppm} \bar{H} \gamma_\beta q \bar{W}_\mu, \]
\[ - C_{\mu,(6)}^{\beta}(H^\dagger H)\bar{H}\gamma_\beta p B - C_{\mu,(6)}^{\beta}(H^\dagger i\Sigma_\beta H)\gamma_\mu q G - C_{\mu,(6)}^{\beta}(H^\dagger D_\beta H)\gamma_\mu u - C_{\mu,(6)}^{\beta}\beta_{\mu ppm} \bar{H} \gamma_\beta q \bar{W}_\mu, \]
\[ - C_{\mu,(6)}^{\beta}(H^\dagger H)\bar{H}\gamma_\beta p B - C_{\mu,(6)}^{\beta}(H^\dagger i\Sigma_\beta H)\gamma_\mu q G - C_{\mu,(6)}^{\beta}(H^\dagger D_\beta H)\gamma_\mu u - C_{\mu,(6)}^{\beta}\beta_{\mu ppm} \bar{H} \gamma_\beta q \bar{W}_\mu, \]
\[ - C_{\mu,(6)}^{\beta}(H^\dagger H)\bar{H}\gamma_\beta p B - C_{\mu,(6)}^{\beta}(H^\dagger i\Sigma_\beta H)\gamma_\mu q G - C_{\mu,(6)}^{\beta}(H^\dagger D_\beta H)\gamma_\mu u - C_{\mu,(6)}^{\beta}\beta_{\mu ppm} \bar{H} \gamma_\beta q \bar{W}_\mu, \]
\[ - C_{\mu,(6)}^{\beta}(H^\dagger H)\bar{H}\gamma_\beta p B - C_{\mu,(6)}^{\beta}(H^\dagger i\Sigma_\beta H)\gamma_\mu q G - C_{\mu,(6)}^{\beta}(H^\dagger D_\beta H)\gamma_\mu u - C_{\mu,(6)}^{\beta}\beta_{\mu ppm} \bar{H} \gamma_\beta q \bar{W}_\mu. \]

\[ \Delta_{\epsilon, (6), j}^{(6)} = -C_{\epsilon,(6)}^{l}(H^\dagger H)\bar{H}\gamma_\epsilon p - C_{\epsilon,(6)}^{l}(H^\dagger i\Sigma_\epsilon H)\gamma_\epsilon p - C_{\epsilon,(6)}^{l}(H^\dagger D_\epsilon H)\gamma_\epsilon p - C_{\epsilon,(6)}^{l}\epsilon_{\mu ppm} \bar{H} \gamma_\epsilon q \bar{W}_\mu, \]
\[ - C_{\epsilon,(6)}^{l}(H^\dagger H)\bar{H}\gamma_\epsilon p B - C_{\epsilon,(6)}^{l}(H^\dagger i\Sigma_\epsilon H)\gamma_\epsilon p B - C_{\epsilon,(6)}^{l}(H^\dagger D_\epsilon H)\gamma_\epsilon p B - C_{\epsilon,(6)}^{l}\epsilon_{\mu ppm} \bar{H} \gamma_\epsilon q \bar{W}_\mu, \]
\[ - C_{\epsilon,(6)}^{l}(H^\dagger H)\bar{H}\gamma_\epsilon p B - C_{\epsilon,(6)}^{l}(H^\dagger i\Sigma_\epsilon H)\gamma_\epsilon p B - C_{\epsilon,(6)}^{l}(H^\dagger D_\epsilon H)\gamma_\epsilon p B - C_{\epsilon,(6)}^{l}\epsilon_{\mu ppm} \bar{H} \gamma_\epsilon q \bar{W}_\mu, \]
\[ - C_{\epsilon,(6)}^{l}(H^\dagger H)\bar{H}\gamma_\epsilon p B - C_{\epsilon,(6)}^{l}(H^\dagger i\Sigma_\epsilon H)\gamma_\epsilon p B - C_{\epsilon,(6)}^{l}(H^\dagger D_\epsilon H)\gamma_\epsilon p B - C_{\epsilon,(6)}^{l}\epsilon_{\mu ppm} \bar{H} \gamma_\epsilon q \bar{W}_\mu. \]

There are additional corrections due to the B number violating operators of $L^{(6)}$. Defining these operators as
\[ Q_{\alpha \mu \nu}^{(a)} = e^{\alpha \beta \rho}(\bar{q}^{\alpha}_{\mu, \nu} D_{\rho}u_{\nu}), \quad Q_{\alpha \mu \nu}^{(b)} = e^{\alpha \beta \rho}(\bar{q}^{\alpha}_{\mu, \nu} D_{\rho}u_{\nu}), \]
\[ Q_{\alpha \mu \nu}^{(c)} = e^{\alpha \beta \rho}(\bar{q}^{\alpha}_{\mu, \nu} D_{\rho}u_{\nu}), \quad Q_{\alpha \mu \nu}^{(d)} = e^{\alpha \beta \rho}(\bar{q}^{\alpha}_{\mu, \nu} D_{\rho}u_{\nu}), \]
results in the EOM corrections of the following form
\[ \Delta_{\epsilon, (6), j}^{(6)} = -e^{\alpha \beta \rho}[C_{\epsilon \mu \nu}^{(a)}(\bar{q}^{\alpha \beta \rho}_{\mu, \nu} D_{\rho}u_{\nu}) u_{\nu}^c + C_{\epsilon \mu \nu}^{(a)}(\bar{q}^{\alpha \beta \rho}_{\mu, \nu} D_{\rho}u_{\nu}) u_{\nu}^c], \]
\[ \Delta_{\epsilon, (6), j}^{(6)} = -e^{\alpha \beta \rho}[C_{\epsilon \mu \nu}^{(a)}(\bar{q}^{\alpha \beta \rho}_{\mu, \nu} D_{\rho}u_{\nu}) u_{\nu}^c + C_{\epsilon \mu \nu}^{(a)}(\bar{q}^{\alpha \beta \rho}_{\mu, \nu} D_{\rho}u_{\nu}) u_{\nu}^c], \]
\[ \Delta_{\epsilon, (6), j}^{(6)} = -e^{\alpha \beta \rho}[C_{\epsilon \mu \nu}^{(a)}(\bar{q}^{\alpha \beta \rho}_{\mu, \nu} D_{\rho}u_{\nu}) u_{\nu}^c + C_{\epsilon \mu \nu}^{(a)}(\bar{q}^{\alpha \beta \rho}_{\mu, \nu} D_{\rho}u_{\nu}) u_{\nu}^c]. \]

(here $\alpha, \beta, \rho$ are SU(3)$c$ indices) and for the SU(2)$L$ doublet fields
\[ \Delta_{\epsilon, (6), j}^{(6)} = -e^{\alpha \beta \rho}[C_{\epsilon \mu \nu}^{(a)}(\bar{q}^{\alpha \beta \rho}_{\mu, \nu} D_{\rho}u_{\nu}) u_{\nu}^c + C_{\epsilon \mu \nu}^{(a)}(\bar{q}^{\alpha \beta \rho}_{\mu, \nu} D_{\rho}u_{\nu}) u_{\nu}^c]. \]

(111)
\[ \Delta_{\epsilon, (6), j}^{(6)} = -e^{\alpha \beta \rho}[C_{\epsilon \mu \nu}^{(a)}(\bar{q}^{\alpha \beta \rho}_{\mu, \nu} D_{\rho}u_{\nu}) u_{\nu}^c + C_{\epsilon \mu \nu}^{(a)}(\bar{q}^{\alpha \beta \rho}_{\mu, \nu} D_{\rho}u_{\nu}) u_{\nu}^c]. \]

(112)
The gauge field EOM corrections are

$$\Delta_{B,\mu}^{(6)} = 2\gamma_{H}(H^\dagger H) \left[ \sum_{\rho,\gamma} C_{\rho,\gamma}(^{(1)}_{\rho,\gamma})_{pr}^{\rho\mu} + \sum_{\rho,\gamma} C_{\rho,\gamma}(^{(3)}_{\rho,\gamma})_{pr}^{\rho\mu} + \frac{C_{\rho,\gamma}}{2} \frac{C_{\rho,\gamma}}{H^\dagger D_{\mu} H} \right] + 2\gamma_{H}(H^\dagger H) \sum_{\rho,\gamma} C_{\rho,\gamma}(^{(3)}_{\rho,\gamma})_{pr}^{\rho\mu} + \frac{4C_{\rho,\gamma}}{g_1} \frac{C_{\rho,\gamma}}{H^\dagger H} B_{\mu},$$

$$+ \frac{4C_{\rho,\gamma}}{g_1} \frac{C_{\rho,\gamma}}{H^\dagger H} B_{\mu} + \frac{2C_{\rho,\gamma}}{g_1} \frac{C_{\rho,\gamma}}{H^\dagger H} H J_{\mu} + \frac{2g_2}{g_1} C_{\rho,\gamma} H^\dagger H J_{\mu},$$

$$+ \frac{2}{g_1} \left( \partial H^\dagger H \right) \left( \frac{\partial H}{\partial x} \right),$$

$$\Delta_{W,\mu}^{(6)} = 2(H^\dagger t H) \left[ \sum_{\rho,\gamma} C_{\rho,\gamma}(^{(1)}_{\rho,\gamma})_{pr}^{\rho\mu} + \sum_{\rho,\gamma} C_{\rho,\gamma}(^{(3)}_{\rho,\gamma})_{pr}^{\rho\mu} + \frac{C_{\rho,\gamma}}{2} \frac{C_{\rho,\gamma}}{H^\dagger D_{\mu} H} \right] + 2i\epsilon^{IJK}(H^\dagger t H) \sum_{\rho,\gamma} C_{\rho,\gamma}(^{(3)}_{\rho,\gamma})_{pr}^{\rho\mu} + \frac{4}{g_2} \frac{C_{\rho,\gamma}}{H^\dagger H} (B_{\mu} + C_{\rho,\gamma} H^\dagger H),$$

$$+ \frac{4C_{\rho,\gamma}}{g_2} \frac{C_{\rho,\gamma}}{H^\dagger H} B_{\mu} + \frac{2}{g_2} \left( \partial H^\dagger H \right) \left( \frac{\partial H}{\partial x} \right),$$

$$\Delta_{A,\mu}^{(6)} = \frac{4}{g_3} \frac{C_{\rho,\gamma}}{H^\dagger H} \left[ C_{\rho,\gamma} G_{A,\mu} + C_{\rho,\gamma} G_{A,\mu} \right] + \frac{4}{g_3} \frac{C_{\rho,\gamma}}{H^\dagger H} \left[ C_{\rho,\gamma} G_{A,\mu} + C_{\rho,\gamma} G_{A,\mu} \right] + \frac{6C_{\rho,\gamma}}{g_3} \frac{C_{\rho,\gamma}}{F_{ABC} \left( \frac{G_{A,\mu}^{A,\mu}}{G_{A,\mu}} \right) + g_3 f_{DEB} \frac{G_{A,\mu}}{g_3} \frac{G_{A,\mu}}{A_1^{A,\mu} + A_1^{A,\mu}}},$$

$$+ \frac{2C_{\rho,\gamma}}{g_3} \frac{C_{\rho,\gamma}}{F_{ABC} \left( \frac{G_{A,\mu}^{A,\mu}}{G_{A,\mu}} \right) + g_3 f_{DEB} \frac{G_{A,\mu}}{g_3} \frac{G_{A,\mu}}{A_1^{A,\mu} + A_1^{A,\mu}}},$$

$$+ \frac{C_{\rho,\gamma}}{g_3} \frac{C_{\rho,\gamma}}{F_{ABC} \left( \frac{G_{A,\mu}^{A,\mu}}{G_{A,\mu}} \right) + g_3 f_{DEB} \frac{G_{A,\mu}}{g_3} \frac{G_{A,\mu}}{A_1^{A,\mu} + A_1^{A,\mu}}}.$$
