Introduction to Skanned.com
Skanned.com provides a Voucher Scanning service for extracting information from vouchers like product lines, total amounts, payment date, sender and recipient.

Vouchers vary heavily in size, layout, purpose and content; the scan quality is occasionally suboptimal. Probabilistic programming provides an opportunity to:

- Combine domain knowledge and machine learning to effectively extract features in a systematic fashion.
- Quantify confidence in results, which is important for manual validation.

Skanned.com’s Pipeline

Finding Features w/Keywords
Features are usually located around identifying keywords. Keywords can be positive or negative depending on the feature to be found.

<table>
<thead>
<tr>
<th>Total Amount Excl. VAT</th>
<th>23613.00 DKK</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total VAT</td>
<td>5903.25 DKK</td>
</tr>
<tr>
<td>Total Amount</td>
<td>29516.25 DKK</td>
</tr>
</tbody>
</table>

Probabilistic model below tries to infer a latent score \( r \) from the vector of observed angles \( \bar{\theta}^+ \) and distances \( \bar{d}^+ \) from positive keywords to potential target features.

\[
\begin{align*}
    r &\sim \mathcal{B}(0.5,0.5) \\
    \bar{r} &= (r, 1 - r) \\
    w_1^+ &= (0.7, 0.3) \\
    \mu_1^+ &= (0, \frac{\pi}{2}) \\
    w_2^+ &= (0.5, 0.2, 0.3) \\
    \mu_2^+ &= (\frac{\pi}{4}, \frac{3\pi}{4}) \\
    \bar{\theta}^+ | r &\sim \sum_{j=1}^{2} \sum_{i=1}^{\lceil |r| \rceil} w_{ji}^+ \cdot \mathcal{N}(\mu_{ji}^+, 4) \\
    \bar{d}^+ | r &\sim \mathcal{N}(500, 1500,1000)
\end{align*}
\]

Evaluating extended version on 1000 vouchers:
- **80%** of the time the expected score found the target feature
- **99%** of the time it was within confidence interval

Practical Experiences

Voucher Grouping
To provide more accurate models, to partition the voucher into groups of similar layout and style. We rely on probabilistic Latent Dirichlet Allocation (LDA) to perform the grouping, using visual (colors, lines) and textual cues (keywords).

For 1000 sample vouchers we achieved 21 topics, and our next goal is to rely on these topics to construct more precise feature extraction models.

The first author would like to thank Dan Rose and the Scanner Team at Skanned.com (Bjørn Kaane, Toke Reines, Danni Dromi) for discussions and feedback on the work!
