REALIZABILITY AND TAMENESS OF FUSION SYSTEMS

CARLES BROTO, JESPER M. MØLLER, BOB OLIVER, AND ALBERT RUIZ

Abstract. A saturated fusion system over a finite $p$-group $S$ is a category whose objects are the subgroups of $S$ and whose morphisms are injective homomorphisms between the subgroups satisfying certain axioms. A fusion system over $S$ is realized by a finite group $G$ if $S$ is a Sylow $p$-subgroup of $G$ and morphisms in the category are those induced by conjugation in $G$. One recurrent question in this subject is to find criteria as to whether a given saturated fusion system is realizable or not.

One main result in this paper is that a saturated fusion system is realizable if all of its components (in the sense of Aschbacher) are realizable. Another result is that all realizable fusion systems are tame: a finer condition on realizable fusion systems that involves describing automorphisms of a fusion system in terms of those of some group that realizes it. Stated in this way, these results depend on the classification of finite simple groups, but we also give more precise formulations whose proof is independent of the classification.

Introduction

Let $p$ be a prime. The fusion system of a finite group $G$ over a Sylow $p$-subgroup $S$ of $G$ is the category $F_S(G)$ whose objects are the subgroups of $S$ and whose morphisms are the homomorphisms between subgroups induced by conjugation in $G$, thus encoding $G$-conjugacy relations among subgroups and elements of $S$. With this as starting point and also motivated by questions in representation theory, Puig defined the concept of abstract fusion systems (see [Pg2] and Definition 1.1) and showed that they behave in many ways like finite groups.

By analogy with finite groups, a component $C$ of a fusion system $F$ is a subnormal fusion subsystem that is quasisimple (i.e., $O^p(C) = C$ and $C/Z(C)$ is simple). The basic properties of components were shown by Aschbacher [A2, Theorem 6] (see also Lemma 4.1 below).

A fusion system $F$ over a finite $p$-group $S$ is realized by a finite group $G$ if $S \in \text{Syl}_p(G)$ and $F \cong F_S(G)$, and is realizable if it is realized by some finite group. One of our main theorems is the following:

Theorem A. Let $p$ be a prime, let $F$ be a saturated fusion system over a finite $p$-group, and let $E \trianglelefteq F$ be a normal fusion subsystem that contains all components of $F$. If $E$ is realizable, then $F$ is also realizable.

Key words and phrases. fusion systems, Sylow subgroups, automorphisms, wreath products, finite simple groups.

J. Møller was partially supported by the Danish National Research Foundation through the Copenhagen Centre for Geometry and Topology (DNRF151).

B. Oliver is partially supported by UMR 7539 of the CNRS.

A. Ruiz is partially supported by MICINN grant PID2020-116481GB-I00 and AGAUR grant 2021-SGR-01015.
The following is an immediate corollary to Theorem A:

**Corollary B.** Let \( p \) be a prime, and let \( \mathcal{F} \) be a saturated fusion system over a finite \( p \)-group. If all components of \( \mathcal{F} \) are realizable, then \( \mathcal{F} \) is realizable.

Corollary B is just the special case of Theorem A where \( \mathcal{E} \) is the generalized Fitting subsystem of \( \mathcal{F} \): the central product of the components of \( \mathcal{F} \) and \( O_p(\mathcal{F}) \). Note, however, that a fusion system can be realizable even when some of its components are not.

For each component \( C \) of \( \mathcal{F} \), \( C/Z(C) \) is simple, and is a composition factor of \( \mathcal{F} \) (see [AKO, §II.10]). Hence one consequence of Corollary B is that \( \mathcal{F} \) is realizable if all of its composition factors are realizable. However, the converse of this is not true either: \( \mathcal{F} \) can be realizable without all of its composition factors being realizable.

In order to prove Theorem A, we need to work with linking systems and tameness. The concept of linking systems associated to fusion systems was first proposed by Benson in [Be3] and in unpublished notes, and was developed in detail by Broto, Levi, and Oliver [BLO2]. See Definition 1.7 for precise definitions. This was originally motivated by questions involving classifying spaces of fusion systems and of the finite groups that they realize, but also turns out to be important when studying many of the purely algebraic properties of fusion systems.

A fusion system \( \mathcal{F} \) is tamely realized by \( G \) if it is realized by \( G \), and in addition, the natural homomorphism from \( \text{Out}(G) \) to \( \text{Out}(\mathcal{L}_S^c(G)) \) is split surjective (Definitions 2.8 and 2.9). Here, \( \mathcal{L}_S^c(G) \) is the linking system associated to \( G \) and to \( \mathcal{F} \). We say that \( \mathcal{F} \) is tame if it is tamely realized by some finite group.

Tameness was originally defined in [AOV, §2], motivated by questions of realizability and extensions of fusion systems, and that is how it is used here in the proof of Theorem A. In this way, it also plays a role in Aschbacher’s program for classifying simple fusion systems over 2-groups and reproving certain parts of the classification of finite simple groups. See [AO, §2.4] for more detail.

Tameness can also be interpreted topologically. For a finite group \( G \), let \( BG^\wedge_p \) be the classifying space of \( G \) completed at \( p \) in the sense of Bousfield and Kan, and let \( \text{Out}(BG^\wedge_p) \) be the set of homotopy classes of self homotopy equivalences of \( BG^\wedge_p \). Then for \( S \in \text{Syl}_p(G) \), the fusion system \( \mathcal{F}_S(G) \) is tamely realized by \( G \) if and only if the natural map from \( \text{Out}(G) \) to \( \text{Out}(BG^\wedge_p) \) is split surjective. We refer to [BLO1, Theorem B], [BLO2, Lemma 8.2], and [AOV, Lemma 1.14] for the proof that \( \text{Out}(\mathcal{L}_S^c(G)) \cong \text{Out}(BG^\wedge_p) \).

We can now state our second main theorem.

**Theorem C.** For each prime \( p \), every realizable fusion system over a finite \( p \)-group is tame.

One of the original motivations for defining tameness in [AOV] was the hope that it might provide a new way to construct exotic fusion systems; i.e., fusion systems not realized by any finite group. By [AOV, Theorem B], if \( \mathcal{F} \) is a reduced fusion system that is not tame, then there is an extension of \( \mathcal{F} \) whose reduction is isomorphic to \( \mathcal{F} \) and is exotic. However, Theorem C tells us that this procedure does not give us any new exotic examples, since if \( \mathcal{F} \) is not tame, then it is itself exotic.

A saturated fusion system \( \mathcal{F} \) is reduced if \( O_p(\mathcal{F}) = 1 \) and \( O'_p(\mathcal{F}) = \mathcal{F} = O''_p(\mathcal{F}) \) (see Definitions 1.3 and 1.14). The reduction \( \text{red}(\mathcal{F}) \) of an arbitrary saturated fusion system \( \mathcal{F} \) is the fusion system obtained by taking \( C_\mathcal{F}(O_p(\mathcal{F}))/Z(O_p(\mathcal{F})) \), and then alternately taking \( O_p(-) \) or \( O''_p(-) \) until the sequence becomes constant. By [AOV, Theorem A], \( \mathcal{F} \) is tame if \( \text{red}(\mathcal{F}) \) is tame. So one immediate consequence of Theorem C is:
Corollary D. If $\mathcal{F}$ is a saturated fusion system over a finite $p$-group $S$, and $\text{red}(\mathcal{F})$ is realizable, then $\mathcal{F}$ is also realizable.

The proofs of Theorems A and C as formulated above, as well as those of Corollaries B and D, require the classification of finite simple groups. But they will be reformulated in Section 5 in a way so as to be independent of the classification. Our main theorem there, Theorem 5.4, is independent of the classification and includes Theorems A and C as special cases (the latter is reformulated as Theorem 5.6).

The first two sections of the paper contain mostly background material: some basic definitions and properties of fusion and linking systems are in Section 1, and those of automorphism groups and tameness in Section 2. We then deal with products in Section 3 and components of fusion systems in Section 4. Theorems A and C, as well as some other applications, are shown in Section 5, as Theorems 5.4 and 5.6.

The authors would like to thank the Universitat Autònoma de Barcelona and the University of Copenhagen for their hospitality while the four authors met during early stages of this work; and also the French CNRS and BigBlueButton for helping us to meet virtually at frequent intervals to discuss this work during the covid-19 pandemic. We would especially like to thank the referee, whose very careful reading of the paper and many suggestions helped us to greatly improve it.

Notation: The notation used in this paper is mostly standard, with a few exceptions. Composition of functions and functors is always from right to left. Also, $C_n$ denotes a (multiplicative) cyclic group of order $n$. When $G$ is a (multiplicative) group, $1 \in G$ always denotes its identity element.

When $f : \mathcal{C} \longrightarrow \mathcal{D}$ is a functor, then for objects $c, c'$ in $\mathcal{C}$, we let $f_{c,c'}$ be the induced map from $\text{Mor}_\mathcal{C}(c, c')$ to $\text{Mor}_\mathcal{D}(f(c), f(c'))$, and also set $f_c = f_{c,c}$ for short.

When $G$ is a group, we indicate conjugation by setting $gx = c_g(x) = gxg^{-1}$ and $gH = c_g(H) = gHg^{-1}$ for $g, x \in G$ and $H \leq G$. Also, for $P, Q \leq G$, we let $\text{Hom}_G(P, Q)$ be the set of (injective) homomorphisms from $P$ to $Q$ induced by conjugation in $G$, and set $\text{Aut}_G(P) = \text{Hom}_G(P, P)$.

Throughout the paper, $p$ will always be a fixed prime.

1. Fusion systems and linking systems

This is a background section intended to provide the reader with the necessary basic definitions and properties of fusion and linking systems that will be used throughout the paper. Fusion systems and saturation were originally introduced by Puig, first in unpublished notes, and then in [Pg2]. Abstract linking systems were defined in [BLO2]. As general references for the subject we refer to [AKO] and [Cr].

1.1. Fusion systems. For a prime $p$, a fusion system over a finite $p$-group $S$ is a category whose objects are the subgroups of $S$, and whose morphisms are injective homomorphisms between subgroups such that for each $P, Q \leq S$:

- $\text{Hom}_\mathcal{F}(P, Q) \supseteq \text{Hom}_S(P, Q)$; and
- for each $\varphi \in \text{Hom}_\mathcal{F}(P, Q)$, $\varphi^{-1} \in \text{Hom}_\mathcal{F}(\varphi(P), P)$.

Here, $\text{Hom}_\mathcal{F}(P, Q)$ denotes the set of morphisms in $\mathcal{F}$ from $P$ to $Q$. We also write $\text{Iso}_\mathcal{F}(P, Q)$ for the set of isomorphisms, $\text{Aut}_\mathcal{F}(P) = \text{Iso}_\mathcal{F}(P, P)$, and $\text{Out}_\mathcal{F}(P) = \text{Aut}_\mathcal{F}(P)/\text{Inn}(P)$. For
Let $F$ be a fusion system over a finite $p$-group $S$.

(a) A subgroup $P \leq S$ is fully normalized (fully centralized) in $F$ if $|N_S(P)| \geq |N_S(Q)|$ ($|C_S(P)| \geq |C_S(Q)|$) for each $Q \in P^F$.

(b) A subgroup $P \leq S$ is fully automized in $F$ if $\operatorname{Aut}_S(P) \in \operatorname{Syl}_p(\operatorname{Aut}_F(P))$.

(c) A subgroup $P \leq S$ is receptive in $F$ if each isomorphism $\varphi \in \operatorname{Iso}_F(Q, P)$ in $F$ extends to a morphism $\bar{\varphi} \in \operatorname{Hom}_F(N_{\varphi}, S)$, where

$$N_{\varphi} = \{g \in N_S(Q) | \varphi c g \varphi^{-1} \in \operatorname{Aut}_S(P)\}.$$  

(d) The fusion system $F$ is saturated if it satisfies the following two conditions:

(I) (Sylow axiom) each subgroup $P \leq S$ fully normalized in $F$ is also fully automized and fully centralized; and

(II) (extension axiom) each subgroup $P \leq S$ fully centralized in $F$ is also receptive.

The above definition is motivated by fusion systems of finite groups. When $G$ is a finite group and $S \in \operatorname{Syl}_p(G)$, the $p$-fusion system of $G$ is the category $F_S(G)$ whose objects are the subgroups of $S$, and where $\operatorname{Mor}_{F_S(G)}(P, Q) = \operatorname{Hom}_G(P, Q)$ for each $P, Q \leq S$. For a proof that $F_S(G)$ is saturated, see, e.g., [AKO, Lemma I.1.2]. In general, a saturated fusion system $F$ over a finite $p$-group $S$ will be called realizable if $F = F_S(G)$ for some finite group $G$ with $S \in \operatorname{Syl}_p(G)$, and will be called exotic otherwise.

The following lemma lists relations between some of these conditions that hold for all fusion systems, not just those that are saturated.

**Lemma 1.2** ([AKO, Lemma I.2.6]). If $F$ is a fusion system over a finite $p$-group $S$, then each receptive subgroup of $S$ is fully centralized, and each subgroup that is fully automized and receptive is fully normalized.

We next list some of the terminology used to describe certain subgroups in a fusion system.

**Definition 1.3.** Let $F$ be a fusion system over a finite $p$-group $S$. For a subgroup $P \leq S$,

(a) $P$ is $F$-centric if $C_S(Q) \leq Q$ for each $Q \in P^F$;

(b) $P$ is $F$-radical if $O_p(\operatorname{Out}_F(P)) = 1$;

(c) $P$ is $F$-quasicentric if for each $Q \in P^F$ which is fully centralized in $F$, the centralizer fusion system $C_F(Q)$ (see Definition 1.5(b)) is the fusion system of the group $C_S(Q)$;

(d) $P$ is weakly closed in $F$ if $P^F = \{P\}$;

(e) $P$ is strongly closed in $F$ if for each $x \in P$, $x^F \subseteq P$;

(f) $P$ is normal in $F$ ($P \trianglelefteq F$) if each $\varphi \in \operatorname{Hom}_F(Q, R)$ (for $Q, R \leq S$) extends to a morphism $\bar{\varphi} \in \operatorname{Hom}_F(PQ, PR)$ such that $\bar{\varphi}(P) = P$; and

(g) $P$ is central in $F$ if each $\varphi \in \operatorname{Hom}_F(Q, R)$ (for $Q, R \leq S$) extends to a morphism $\bar{\varphi} \in \operatorname{Hom}_F(PQ, PR)$ such that $\bar{\varphi}|_P = \operatorname{Id}_P$.
Let $\mathcal{F}^{cr} \subseteq \mathcal{F}^c \subseteq \mathcal{F}^q$ denote the sets of $\mathcal{F}$-centric $\mathcal{F}$-radical, $\mathcal{F}$-centric, and $\mathcal{F}$-quasicentric subgroups of $S$, respectively, or (depending on the context) the full subcategories of $\mathcal{F}$ with those objects. Let $O_p(\mathcal{F}) \geq Z(\mathcal{F})$ denote the (unique) largest normal and central subgroups, respectively, in $\mathcal{F}$.

The following result is one of the versions of Alperin’s fusion theorem for fusion systems.

**Theorem 1.4.** Let $\mathcal{F}$ be a saturated fusion system over a finite $p$-group $S$. Then each morphism in $\mathcal{F}$ is a composite of restrictions of automorphisms of subgroups that are $\mathcal{F}$-centric, $\mathcal{F}$-radical, and fully normalized in $\mathcal{F}$. 

**Proof.** This follows from [AKO, Theorem I.3.6] (the same statement but for $\mathcal{F}$-essential subgroups), together with [AKO, Proposition I.3.3(a)] (all $\mathcal{F}$-essential subgroups are $\mathcal{F}$-centric and $\mathcal{F}$-radical). Alternatively, the result as stated here is shown directly (without mention of essential subgroups) in [BLO2, Theorem A.10]. $\square$

**Definition 1.5.** Let $\mathcal{F}$ be a saturated fusion system over a finite $p$-group $S$, and let $Q \leq S$ be a subgroup.

(a) For each $K \leq \text{Aut}(Q)$, set $N^K_S(Q) = \{ x \in N_S(Q) \mid c_x \in K \}$, and let $N^K_F(Q)$ be the fusion system over $N^K_S(Q)$ in which for $P, R \leq N^K_S(Q)$,

$$\text{Hom}_{N^K_F(Q)}(P, R) = \{ \varphi \in \text{Hom}_F(P, R) \mid \text{there is } \varphi' \in \text{Hom}_F(PQ, RQ) \text{ such that } \varphi|R = \varphi, \varphi(Q) = Q, \varphi|K \in K \}.$$ 

(b) Set $N_F(Q) = N^{\text{Aut}(Q)}_F(Q)$ and $C_F(Q) = C^{(1)}_F(Q)$.

If $Q$ is fully normalized (fully centralized) in $\mathcal{F}$ then $N_F(Q) (C_F(Q))$ is a saturated fusion system (see [BLO2, Proposition A.6] or [AKO, Theorem I.5.5]). There is a similar condition (see [AKO, Theorem I.5.5]) that implies that $N^K_F(Q)$ is saturated. Note that $Q \leq \mathcal{F}$ if and only if $N_F(Q) = \mathcal{F}$, and $Q$ is central in $\mathcal{F}$ (i.e., $Q \leq Z(\mathcal{F})$) if and only if $C_F(Q) = \mathcal{F}$.

**Lemma 1.6.** Let $G$ be a finite group with $S \in \text{Syl}_p(G)$, and set $\mathcal{F} = \mathcal{F}_S(G)$.

(a) For each $Q \leq S$, $Q$ is fully normalized (fully centralized) if and only if $N_S(Q) \leq \text{Syl}_p(N_G(Q)) (C_S(Q) \leq \text{Syl}_p(C_G(Q)))$. If this holds, then $N_F(Q) = \mathcal{F}_{N_S(Q)}(N_G(Q)) (C_F(Q) = \mathcal{F}_{C_S(Q)}(C_G(Q)))$.

(b) In all cases, $O_p(G) \leq O_p(\mathcal{F})$ and $O_p(Z(G)) \leq Z(\mathcal{F})$.

**Proof.** Point (a) is shown in [AKO, Proposition I.5.4]. In particular, when $Q = O_p(G)$, we have $N_F(Q) = \mathcal{F}_S(G) = \mathcal{F}$ and hence $Q \leq O_p(\mathcal{F})$. Similarly, when $Q = O_p(Z(G))$, it says that $C_F(Q) = \mathcal{F}_S(G) = \mathcal{F}$ and hence that $Q \leq Z(\mathcal{F})$. $\square$

### 1.2. Linking systems.

Before recalling the definition of linking systems, we need to introduce more notation. If $P, Q \leq G$ are subgroups of a finite group $G$, the transporter set $T_G(P, Q)$ is defined by setting

$$T_G(P, Q) = \{ g \in G \mid gP \leq Q \}.$$ 

The transporter category of $G$ is the category $\mathcal{T}(G)$ whose objects are the subgroups of $G$, and whose morphisms sets are the transporter sets:

$$\text{Mor}_{\mathcal{T}(G)}(P, Q) = T_G(P, Q).$$

Composition in $\mathcal{T}(G)$ is given by multiplication in $G$. If $\mathcal{H}$ is a set of subgroups of $G$, then $\mathcal{T}_\mathcal{H}(G) \subseteq \mathcal{T}(G)$ denotes the full subcategory with object set $\mathcal{H}$. 

The following definition of linking system taken from [AKO, Definition III.4.1].

**Definition 1.7.** Let $\mathcal{F}$ be a fusion system over a finite $p$-group $S$. A linking system associated to $\mathcal{F}$ is a triple $(\mathcal{L}, \delta, \pi)$ where $\mathcal{L}$ is a finite category, and $\delta$ and $\pi$ are a pair of functors

$$\mathcal{T}_{\text{Ob}(\mathcal{L})}(S) \xrightarrow{\delta} \mathcal{L} \xrightarrow{\pi} \mathcal{F}$$

that satisfy the following conditions:

1. (A1) $\text{Ob}(\mathcal{L})$ is a set of subgroups of $S$ closed under $\mathcal{F}$-conjugacy and overgroups, and contains $\mathcal{F}^c$. Each object in $\mathcal{L}$ is isomorphic (in $\mathcal{L}$) to one which is fully centralized in $\mathcal{F}$.

2. (A2) $\delta$ is the identity on objects, and $\pi$ is the inclusion on objects. For each $P, Q \in \text{Ob}(\mathcal{L})$ such that $P$ is fully centralized in $\mathcal{F}$, $C_S(P)$ acts freely on $\text{Mor}_{\mathcal{L}}(P, Q)$ via $\delta_P$ and right composition, and

$$\pi_{P,Q} : \text{Mor}_{\mathcal{L}}(P, Q) \to \text{Hom}_{\mathcal{F}}(P, Q)$$

is the orbit map for this action.

3. (B) For each $P, Q \in \text{Ob}(\mathcal{L})$ and each $g \in T_S(P, Q)$, $\pi_{P,Q}$ sends $\delta_P^g = \delta_P \circ g$ to $\pi_{P,Q}(\delta_P^g) \in \text{Mor}_{\mathcal{L}}(P, Q)$ to $c_g \in \text{Hom}_{\mathcal{F}}(P, Q)$.

4. (C) For all $\psi \in \text{Mor}_{\mathcal{L}}(P, Q)$ and all $g \in P$, the diagram

$$\begin{array}{ccc}
P & \xrightarrow{\psi} & Q \\
\delta_P(g) \downarrow & & \downarrow \delta_Q(\pi(\psi)(g)) \\
P & \xrightarrow{\psi} & Q
\end{array}$$

commutes in $\mathcal{L}$.

When the functors $\delta$ and $\pi$ are understood, we refer directly to the category $\mathcal{L}$ as a linking system.

A **centric linking system** associated to $\mathcal{F}$ is a linking system $\mathcal{L}$ associated to $\mathcal{F}$ such that $\text{Ob}(\mathcal{L}) = \mathcal{F}^c$.

Linking systems associated to a fusion system were originally motivated by centric linking systems of finite groups. For a finite group $G$, a $p$-subgroup $P \leq G$ is $p$-centric in $G$ if $Z(P) \in \text{Syl}_p(C_G(P))$; equivalently, if $C_G(P) = Z(P) \times O_{p'}(C_G(P))$. For $S \in \text{Syl}_p(G)$, the **centric linking system** of $G$ over $S$ consists of the category $\mathcal{L}_S^c(G)$ whose objects are the subgroups of $S$ which are $p$-centric in $G$ and whose morphism sets are given by

$$\text{Mor}_{\mathcal{L}_S^c(G)}(P, Q) = T_G(P, Q)/O_{p'}(C_G(P)) \quad (\text{all } P, Q \in \text{Ob}(\mathcal{L}_S^c(G)))$$

together with functors $\mathcal{T}_{\text{Ob}(\mathcal{L}_S^c(G))}(S) \xrightarrow{\delta} \mathcal{L}_S^c(G) \xrightarrow{\pi} \mathcal{F}_S(G)$ defined in the obvious way.

When $G$ is a finite group and $S \in \text{Syl}_p(G)$, then $P \leq S$ is $\mathcal{F}$-centric (see Definition 1.3) if and only if $P$ is $p$-centric in $G$ (see [BLO1, Lemma A.5]). Moreover, $\mathcal{F}_S(G)$ is always saturated (see [AKO, Theorem I.2.3]), and $(\mathcal{L}_S^c(G), \delta, \pi)$ is a centric linking system associated to $\mathcal{F}_S(G)$.

Some of the basic properties of linking systems are listed in the next proposition.

**Proposition 1.8.** Let $(\mathcal{L}, \delta, \pi)$ be a linking system associated to a saturated fusion system $\mathcal{F}$ over a finite $p$-group $S$. For each pair of subgroups $P \leq Q \leq S$ with $P, Q \in \text{Ob}(\mathcal{L})$, set $\iota_{P,Q} = \delta_{P,Q}(1) \in \text{Mor}_{\mathcal{L}}(P, Q)$ (the inclusion in $\mathcal{L}$ of $P$ into $Q$). Then

(a) $\delta$ is injective on all morphism sets; and
(b) all morphisms in $\mathcal{L}$ are monomorphisms and epimorphisms in the categorical sense.

Conditions for the existence of restrictions and extensions of morphisms are as follows:

(c) For every morphism $\psi \in \text{Mor}_\mathcal{L}(P, Q)$, and every $P_0, Q_0 \in \text{Ob}(\mathcal{L})$ such that $P_0 \leq P$, $Q_0 \leq Q$, and $\pi(\psi)(P_0) \leq Q_0$, there is a unique morphism $\psi|_{P_0, Q_0} \in \text{Mor}_\mathcal{L}(P_0, Q_0)$ (the “restriction” of $\psi$) such that $\psi \circ \iota_{P_0, P} = \iota_{Q_0, Q} \circ \psi|_{P_0, Q_0}$.

(d) Let $P, Q, \overline{P}, \overline{Q} \in \text{Ob}(\mathcal{L})$ and $\psi \in \text{Mor}_\mathcal{L}(P, Q)$ be such that $P \leq \overline{P}$, $Q \leq \overline{Q}$, and for each $g \in \overline{P}$ there is $h \in \overline{Q}$ such that $\iota_{Q, \overline{Q}} \circ \psi \circ \delta_P(g) = \delta_{Q, \overline{Q}}(h) \circ \psi$. Then there is a unique morphism $\overline{\psi} \in \text{Mor}_\mathcal{L}(\overline{P}, \overline{Q})$ such that $\overline{\psi}|_{P, Q} = \psi$.

Proof. See points (c), (f), (b), and (e), respectively, in [O2, Proposition 4].

We note here the existence and uniqueness of linking systems shown by Chermak, Oliver, and Glauberman-Lynd. Two linking systems $(\mathcal{L}_1, \delta_1, \pi_1)$ and $(\mathcal{L}_2, \delta_2, \pi_2)$ associated to the same fusion system $F$ are isomorphic if there is an isomorphism of categories $\rho: \mathcal{L}_1 \xrightarrow{\cong} \mathcal{L}_2$ such that $\rho \circ \delta_1 = \delta_2$ and $\pi_2 \circ \rho = \pi_1$.

**Theorem 1.9** ([Ch, O3, GLn1]). Let $F$ be a saturated fusion system over a finite $p$-group $S$, and let $\mathcal{H}$ be a set of subgroups of $S$ such that $F^{\text{cr}} \subseteq \mathcal{H} \subseteq F^\ell$, and such that $\mathcal{H}$ is closed under $F$-conjugacy and overgroups. Then up to isomorphism, there is a unique linking system $\mathcal{L}^\mathcal{H}$ associated to $F$ with object set $\mathcal{H}$.

Proof. The existence and uniqueness of a centric linking system associated to $F$ was shown by Chermak. See [Ch, Main theorem] and [O3, Theorem A] for two versions of his original proof, and [GLn1, Theorem 1.2] for the changes to the proof in [O3] needed to make it independent of the classification of finite simple groups.

More generally, if $F^{\text{cr}} \subseteq \mathcal{H} \subseteq F^{\text{c}}$, the uniqueness of an $\mathcal{H}$-linking system follows by the same obstruction theory (shown to vanish in [O3, Theorem 3.4] and [GLn1, Theorem 1.1]) as that used in the centric case (by the same argument as in the proof of [BLO2, Proposition 3.1]). For arbitrary $\mathcal{H} \subseteq F^\ell$ containing $F^{\text{cr}}$, the existence and uniqueness now follows from [AKO, Proposition III.4.8], applied with $\mathcal{H} \supseteq \mathcal{H} \cap F^{\text{c}}$ in the role of $\hat{\mathcal{H}} \supseteq \mathcal{H}$.

1.3. Normal fusion and linking subsystems. Let $F$ be a fusion system over a finite $p$-group $S$. A fusion subsystem of $F$ is a subcategory $\mathcal{E} \subseteq F$ which is itself a fusion system over a subgroup $T \leq S$ (in particular, $\text{Ob}(\mathcal{E})$ is the set of subgroups of $T$). We write $\mathcal{E} \leq F$ when $\mathcal{E}$ is a fusion subsystem, and also sometimes say that $\mathcal{E} \leq F$ is a pair of fusion systems over $T \leq S$.

**Definition 1.10.** Let $F$ be a fusion system over a finite $p$-group $S$.

(a) Let $R$ be another finite $p$-group and let $\alpha: S \rightarrow R$ be an isomorphism. We denote by $^\alpha F$ the fusion system over $R$ with morphism sets

$$\text{Hom}_{^\alpha F}(P, Q) = \alpha \circ \text{Hom}_F(\alpha^{-1}(P), \alpha^{-1}(Q)) \circ \alpha^{-1}$$

for each pair of subgroups $P, Q \leq R$.

(b) Let $\mathcal{E}$ be another fusion system over a finite $p$-group $T$. We say that $\mathcal{E}$ and $F$ are isomorphic fusion systems if there is an isomorphism $\alpha: S \rightarrow T$ such that $\mathcal{E} = ^\alpha F$.

A more general concept of morphism between fusion systems is given in [AKO, Definition II.2.2].
Consider now the following definition from [AKO, Definition I.6.1].

**Definition 1.11.** Fix a saturated fusion system $\mathcal{F}$ over a finite $p$-group $S$.

(a) A fusion subsystem $\mathcal{E} \subseteq \mathcal{F}$ over $T \unlhd S$ is weakly normal if $\mathcal{E}$ is saturated, $T$ is strongly closed in $\mathcal{F}$, and the following conditions hold:

- (invariance condition) $\mathcal{E} = \mathcal{E}$ for each $\alpha \in \text{Aut}_\mathcal{F}(T)$, and
- (Frattini condition) for each $P \leq T$ and each $\varphi \in \text{Hom}_\mathcal{F}(P,T)$, there are $\alpha \in \text{Aut}_\mathcal{F}(T)$ and $\varphi_0 \in \text{Hom}_\mathcal{E}(P,T)$ such that $\varphi = \alpha \circ \varphi_0$.

(b) A fusion subsystem $\mathcal{E} \subseteq \mathcal{F}$ over $T \unlhd S$ is normal ($\mathcal{E} \unlhd \mathcal{F}$) if $\mathcal{E}$ is weakly normal in $\mathcal{F}$ and

- (Extension condition) each $\alpha \in \text{Aut}_\mathcal{E}(T)$ extends to $\tilde{\alpha} \in \text{Aut}_\mathcal{F}(TC_S(T))$ such that $[\tilde{\alpha}, C_S(T)] \leq Z(T)$.

(c) A saturated fusion system $\mathcal{F}$ over a finite $p$-group $S$ is simple if it contains no proper nontrivial normal fusion subsystem.

It will be convenient to say that “$\mathcal{E} \unlhd \mathcal{F}$ is a normal pair of fusion systems over $T \unlhd S$” to mean that $\mathcal{F}$ is a fusion system over $S$ and $\mathcal{E} \unlhd \mathcal{F}$ is a normal subsystem over $T$.

Note that if $\mathcal{F}$ is a saturated fusion system over a finite $p$-subgroup $S$, and $P \leq S$, then $P \unlhd \mathcal{F}$ if and only if $\mathcal{F}_P(P) \unlhd \mathcal{F}$ [A2, (7.9)].

Note also that what are called “normal fusion subsystems” in [AOV, Definition 1.18] are what we are calling “weakly normal” subsystems here.

When $(\mathcal{L}, \delta, \pi)$ is a linking system associated to the fusion system $\mathcal{F}$ over $S$, and $\mathcal{F}_0 \subseteq \mathcal{F}$ is a fusion subsystem over $S_0 \leq S$, then a linking subsystem associated to $\mathcal{F}_0$ is a linking system $(\mathcal{L}_0, \delta_0, \pi_0)$ associated to $\mathcal{F}_0$, where $\mathcal{L}_0$ is a subcategory of $\mathcal{L}$ and

\[
\mathcal{T}_{\text{Ob}(\mathcal{L}_0)}(S_0) \xrightarrow{\delta_0} \mathcal{L}_0 \xrightarrow{\pi_0} \mathcal{F}_0
\]

are the restrictions of $\delta$ and $\pi$. In this situation, we write $\mathcal{L}_0 \subseteq \mathcal{L}$, and sometimes say that $\mathcal{L}_0 \subseteq \mathcal{L}$ is a pair of linking systems. Note in particular the special case where $S_0 = S$ and $\mathcal{F}_0 = \mathcal{F}$ but $\text{Ob}(\mathcal{L}_0) \subseteq \text{Ob}(\mathcal{L})$: a pair of linking systems with possibly different object sets associated to the same fusion system.

**Definition 1.12.** Fix a pair of saturated fusion systems $\mathcal{E} \subseteq \mathcal{F}$ over finite $p$-groups $T \unlhd S$ such that $\mathcal{E} \unlhd \mathcal{F}$, and let $\mathcal{M} \subseteq \mathcal{L}$ be a pair of associated linking systems. Then, $\mathcal{M}$ is normal in $\mathcal{L}$ ($\mathcal{M} \unlhd \mathcal{L}$) if:

(a) $\text{Ob}(\mathcal{L}) = \{P \leq S \mid P \cap T \in \text{Ob}(\mathcal{M})\}$, and

(b) for all $\gamma \in \text{Aut}_\mathcal{L}(T)$ and $\psi \in \text{Mor}(\mathcal{M})$, $\gamma \psi \gamma^{-1} \in \text{Mor}(\mathcal{M})$.

If $\mathcal{M} \unlhd \mathcal{L}$, then we define $\mathcal{L}/\mathcal{M} = \text{Aut}_\mathcal{L}(T)/\text{Aut}_{\mathcal{M}}(T)$.

Notice that not every normal pair of linking systems has an associated normal pair of linking systems.

Definition 1.12 differs from Definition 1.27 in [AOV] in that there is no “Frattini condition” in the definition we give here. We have omitted it since it follows from the Frattini condition for normal fusion subsystems, as shown in the next lemma.

**Lemma 1.13.** If $\mathcal{M} \unlhd \mathcal{L}$ is a normal pair of linking systems associated to fusion systems $\mathcal{E} \subseteq \mathcal{F}$ over finite $p$-groups $T \unlhd S$, then for all $P, Q \in \text{Ob}(\mathcal{M})$ and all $\psi \in \text{Mor}_\mathcal{L}(P,Q)$, there are morphisms $\gamma \in \text{Aut}_\mathcal{L}(T)$ and $\psi_0 \in \text{Mor}_{\mathcal{M}}(\gamma(P), Q)$ such that $\psi = \psi_0 \circ \gamma|_{\gamma(P)}$. 
1.4. Fusion subsystems of $p$-power index and index prime to $p$. We recall some more definitions.

**Definition 1.14.** Let $\mathcal{F}$ be a saturated fusion system over a finite $p$-group $S$.

(a) Set $\text{foc}(\mathcal{F}) = \{g^{-1}h \mid g, h \in S, h \in g^\mathcal{F}\} = \{g^{-1}\alpha(g) \mid g \in P \leq S, \alpha \in \text{Aut}_\mathcal{F}(P)\}$ (the focal subgroup of $\mathcal{F}$).

(b) Set $\text{hyp}(\mathcal{F}) = \{g^{-1}\alpha(g) \mid g \in P \leq S, \alpha \in \text{Op}(\text{Aut}_\mathcal{F}(P))\}$ (the hyperfocal subgroup of $\mathcal{F}$).

(c) A saturated fusion subsystem $\mathcal{E} \leq \mathcal{F}$ over $T \leq S$ has $p$-power index if $T \geq \text{hyp}(\mathcal{F})$, and $\text{Aut}_\mathcal{E}(P) \geq \text{Op}(\text{Aut}_\mathcal{F}(P))$ for all $P \leq T$. The smallest normal subsystem of $p$-power index is denoted $\text{Op}(\mathcal{F})$.

(d) A saturated fusion subsystem $\mathcal{E} \leq \mathcal{F}$ over $T \leq S$ has index prime to $p$ if $T = S$ and $\text{Aut}_\mathcal{E}(P) \geq \text{Op}(\text{Aut}_\mathcal{F}(P))$ for all $P \leq T$. The smallest normal subsystem of index prime to $p$ is denoted $\text{Op}^p(\mathcal{F})$.

For the existence of the minimal subsystems $\text{Op}(\mathcal{F})$ and $\text{Op}^p(\mathcal{F})$, see, e.g., Theorems I.7.4 and I.7.7 in [AKO].

**Lemma 1.15.** (a) If $G$ is a finite group with $S \subseteq \text{Syl}_p(G)$, then $\text{foc}(\mathcal{F}_S(G)) = S \cap [G, G]$ and $\text{hyp}(\mathcal{F}_S(G)) = S \cap \text{Op}(G)$.

(b) If $\mathcal{F}$ is a saturated fusion system over a finite $p$-group $S$, then $\text{Op}(\mathcal{F})$ and $\text{Op}^p(\mathcal{F})$ are fusion subsystems over $\text{hyp}(\mathcal{F})$ and $S$, respectively, and are both normal in $\mathcal{F}$. Also, $\text{Op}(\mathcal{F}) = \mathcal{F} \iff \text{hyp}(\mathcal{F}) = S \iff \text{foc}(\mathcal{F}) = S$.

**Proof.** The first statement in (a) is the focal subgroup theorem (see [G, Theorem 7.3.4]), and the second is Puig’s hyperfocal subgroup theorem [Pg1, §1.1].

Point (b) is due to Puig, and is also shown in Theorems I.7.4 and I.7.7 and Corollary I.7.5 in [AKO]. □
Lemma 1.16. Let $\mathcal{F}$ be a saturated fusion system over a finite $p$-group $S$, fix $Q \leq S$, and let $K \leq \text{Aut}(Q)$ be a subgroup of $p$-power order. Assume that $Q$ is fully centralized in $\mathcal{F}$ and that $\text{Aut}_K^K(Q) \in \text{Syl}_p(\text{Aut}_F^K(Q))$. Then $N^K_F(Q)$ is saturated, and $C_F(Q)$ is normal of $p$-power index in $N^K_F(Q)$.

Proof. By Proposition I.5.2 and Theorem I.5.5 in [AKO], the fusion systems $C_F(Q)$ and $N^K_F(Q)$ are saturated. So it suffices to prove the lemma when $\mathcal{F} = N^K_F(Q)$; i.e., when $Q \leq F$ and $K \geq \text{Aut}_F(Q)$. Then $C_F(Q) \leq F$ by [Cr, Proposition 8.8].

We claim that $P \leq S$, $\alpha \in \text{Aut}_F(P)$ of order prime to $p$ implies $\alpha$ extends to $\bar{\alpha} \in \text{Aut}_F(PQ)$ with $\alpha|_Q = \text{Id}_Q$. (1.1)

Since $Q \leq F$, $\alpha$ extends to $\bar{\alpha} \in \text{Aut}_F(PQ)$, and we can arrange that $\bar{\alpha}$ also has order prime to $p$. But $\bar{\alpha}|_Q \in K$ by assumption, hence has $p$-power order, and so $\bar{\alpha}|_Q = \text{Id}_Q$.

We next check that $C_S(Q) \geq \text{hy}(\mathcal{F})$. Fix $P \leq S$, and $\alpha \in \text{Aut}_F(P)$ of order prime to $p$. By (1.1), $\alpha$ extends to $\bar{\alpha} \in \text{Aut}_F(PQ)$ such that $\bar{\alpha}|_Q = \text{Id}_Q$. But then $[[\alpha, P], Q] \leq [\bar{\alpha}, PQ, Q] = 1$ by the 3-subgroup lemma (see [G, Theorem 2.2.3] or [A1, 8.7]) and since $[P, Q] \leq Q$ and $[\bar{\alpha}, Q] = 1$. So $[\alpha, P] \leq C_S(Q)$. Since $\text{hy}(\mathcal{F})$ is generated by such subgroups $[\alpha, P]$, this proves that $\text{hy}(\mathcal{F}) \leq C_S(Q)$.

It remains to show, for all $P \leq C_S(Q)$, that $\text{Aut}_{C_F(P)}(P)$ contains $O^p(\text{Aut}_F(P))$. But this follows directly from (1.1), which says that each $\alpha \in \text{Aut}_F(P)$ of order prime to $p$ lies in $\text{Aut}_{C_F(P)}(P)$. Thus $C_F(Q)$ has $p$-power index in $\mathcal{F}$. $\square$

1.5. Quotient fusion systems. We begin with the basic definition and properties.

Definition 1.17. Let $\mathcal{F}$ be a fusion system over a finite $p$-group $S$, and assume $Q \leq S$ is strongly closed in $\mathcal{F}$. Then $\mathcal{F}/Q$ is defined to be the fusion system over $S/Q$ where

$$\text{Hom}_{\mathcal{F}/Q}(P/Q, R/Q) = \{\varphi/Q \mid \varphi \in \text{Hom}_{\mathcal{F}}(P, R)\}$$

for $P, R \leq S$ containing $Q$. Here, $\varphi/Q \in \text{Hom}(P/Q, R/Q)$ sends $gQ$ to $\varphi(g)Q$.

Note that by definition, $\mathcal{F}/Q = N_F(Q)/Q$. If $\mathcal{F} = \mathcal{F}_S(G)$ for some finite group $G$ with $S \leq \text{Syl}_p(G)$, and $H \leq G$ is such that $Q = H \cap S$, then $\mathcal{F}/Q \cong \mathcal{F}_{SH/H}(G/H)$ (see [Cr, Theorem 5.20]).

Lemma 1.18. Let $\mathcal{F}$ be a saturated fusion system over a finite $p$-group $S$, and assume $Q \leq S$ is strongly closed in $\mathcal{F}$. Then $\mathcal{F}/Q$ is normal. If $\mathcal{E} \leq \mathcal{F}$ is a normal fusion subsystem over $T \leq S$ such that $T \geq Q$, then $\mathcal{E}/Q \leq \mathcal{F}/Q$.

Proof. For a proof that $\mathcal{F}/Q$ is saturated, see [Cr, Proposition 5.11] or [AKO, Lemma II.5.4]. If $\mathcal{E} \leq \mathcal{F}$ over $T \geq Q$, then $\mathcal{E}/Q$ is saturated since $\mathcal{E}$ is, $T/Q$ is strongly closed in $\mathcal{F}/Q$, and the invariance and Frattini conditions for normality of $\mathcal{E}/Q \leq \mathcal{F}/Q$ follow immediately from those for $\mathcal{E} \leq \mathcal{F}$ (see [Cr, Lemma 5.59] for details).

It remains to prove the extension condition for $\mathcal{E}/Q \leq \mathcal{F}/Q$. We must show, for each $\varphi \in \text{Aut}_{\mathcal{E}/Q}(T/Q)$, that $\varphi$ extends to some $\overline{\varphi} \in \text{Aut}_{\mathcal{F}/Q}((T/Q)C_S/(T/Q))$ such that $[\overline{\varphi}, C_{S/Q}(T/Q)] \leq Z(T/Q)$. This clearly holds when $\varphi \in \text{Inn}(T/Q) \in \text{Syl}_p(\text{Aut}_{\mathcal{E}/Q}(T/Q))$, so it will suffice to prove it when $\varphi$ has order prime to $p$. Let $U \leq S$ be such that $Q \leq U$ and $C_{S/Q}(T/Q) = U/Q$.

By [A2, Theorem 5] or [He1, Theorem 1], there is a (unique) saturated fusion subsystem $\mathcal{E}S \leq \mathcal{F}$ over $S$ such that $\mathcal{E}$ is normal of $p$-power index in $\mathcal{E}S$. Since $\mathcal{E}S$ is saturated, so
is $\mathcal{E}S/Q$. So by the extension axiom, $\varphi$ extends to some $\bar{\varphi} \in \text{Aut}_{\mathcal{E}S/Q}(TU/Q)$, and upon replacing $\bar{\varphi}$ by $\bar{\varphi}^k$ for some $k$, we can arrange that $\bar{\varphi}$ have order prime to $p$. Then $\bar{\varphi} = \hat{\varphi}/T$ for some $\hat{\varphi} \in \text{Aut}_{\mathcal{E}S}(TU)$, and we can again arrange that $\hat{\varphi}$ have order prime to $p$.

By definition of the hyperfocal subgroup, $[\hat{\varphi},TU] \leq \text{Hy}(\mathcal{E}S) \leq T$, where the last inclusion holds since $O^p(\mathcal{E}S) \leq \mathcal{E}$. Thus $[\varphi,TU/Q] \leq T/Q$, and so $[\varphi,C_{S/Q}(T/Q)] = [\varphi,U/Q] \leq (T \cap U)/Q = Z(T/Q)$. (We thank the referee for pointing out this short argument.)

We refer to [AKO, §II.5] and [Cr, §5.2] for some of the other properties of these quotient systems.

The next lemma involves normal fusion subsystems of index prime to $p$ (see Definition 1.14).

**Lemma 1.19.** Let $\mathcal{F}$ be a saturated fusion system over a finite $p$-group $S$, and let $Z \leq Z(\mathcal{F})$ be a central subgroup. Then $O^p(\mathcal{F}/Z) = O^p(\mathcal{F})/Z$.

**Proof.** Set $\mathcal{H} = \{P \in \mathcal{F}^c \mid P/Z \in (\mathcal{F}/Z)^c\}$. (Note that for $P \in \mathcal{F}^c$, $P \geq Z(S) \geq Z$.) For each $P \in \mathcal{F}^c \setminus \mathcal{H}$ that is fully normalized in $\mathcal{F}$, $P/Z$ is fully normalized in $\mathcal{F}/Z$, and hence $C_{S/Z}(P/Z) \leq P/Z$. Choose $x \in S \setminus P$ such that $xZ \in C_{S/Z}(P/Z)$, and consider the automorphism $c_x \in \text{Aut}_S(P)$. Then $c_x \notin \text{Inn}(P)$ since $P \in \mathcal{F}^c$, and $c_x$ induces the identity on $Z$ and on $P/Z$. Since $\alpha \in \text{Aut}_\mathcal{F}(P)|\{\alpha, P\} \leq Z$ is a normal $p$-subgroup of $\text{Aut}_\mathcal{F}(P)$ (see [G, Corollary 5.3.3]), this proves that $c_x \in O_p(\text{Aut}_\mathcal{F}(P))$, and hence that

$$\text{for each } P \in \mathcal{F}^c \setminus \mathcal{H} \text{ there is } P^* \in P^\mathcal{F} \text{ with } \text{Out}_\mathcal{S}(P^*) \cap O_p(\text{Out}_\mathcal{F}(P^*)) \neq 1.$$ (1.2)

By [AKO, Theorem I.7.7], there is a finite group $\Gamma$ of order prime to $p$, and a map $\theta: \text{Mor}(\mathcal{F}/Z)^c \to \Gamma$ that sends composites to products and inclusions to the identity, and is such that $\theta(\text{Aut}_{\mathcal{F}/Z}(S/Z)) = \Gamma$ and $O^\theta(\mathcal{F}/Z) = \langle \theta^{-1}(1) \rangle$. Let $\mathcal{F}^\mathcal{H} \subseteq \mathcal{F}$ be the full subcategory with object set $\mathcal{H}$, and let $\Phi$ be the natural map from $\text{Mor}(\mathcal{F}^\mathcal{H})$ to $\text{Mor}(\mathcal{F}/Z)^c$. Set $\mathcal{F}_0 = \langle (\theta \Phi)^{-1}(1) \rangle$: a fusion subsystem of $\mathcal{F}$ over $S$. By [O4, Lemma 1.6] and (1.2), $\mathcal{F}_0 \geq O^\theta(\mathcal{F})$ and is saturated. Thus $O^\theta(\mathcal{F})/Z \leq \mathcal{F}_0/Z \leq O^\theta(\mathcal{F}/Z)$.

Conversely, $O^\theta(\mathcal{F})/Z$ has index prime to $p$ in $\mathcal{F}/Z$ since for each $P/Z \leq S/Z$, we have $\text{Aut}_{O^\theta(\mathcal{F})/Z}(P/Z) \geq O^\theta(\text{Aut}_{\mathcal{F}/Z}(P/Z))$. So $O^\theta(\mathcal{F})/Z \geq O^\theta(\mathcal{F}/Z)$. \hfill $\square$

The following construction is needed when we want to look at the image of $\mathcal{E} \subseteq \mathcal{F}$ in $\mathcal{F}/Q$ but $\mathcal{E}$ does not contain $Q$.

**Definition 1.20.** Let $\mathcal{E} \leq \mathcal{F}$ be a pair of saturated fusion systems over $T \leq S$, and let $Z \leq Z(\mathcal{F})$ be a central subgroup. Define $Z\mathcal{E} \leq \mathcal{F}$ to be the fusion subsystem over $ZT$ where for each $P,Q, P \leq ZT$,

$$\text{Hom}_{Z\mathcal{E}}(P,Q) = \{ \varphi \in \text{Hom}_\mathcal{F}(P,Q) \mid \varphi|_{P \cap T} \in \text{Hom}_\mathcal{E}(P \cap T, Q \cap T) \}.$$

If $\mathcal{E} \leq \mathcal{F}$, then the above definition is a special case of a construction of Aschbacher [A2, Theorem 5]. But the definition and arguments in this very restricted case are much more elementary.

**Lemma 1.21.** Let $\mathcal{E} \leq \mathcal{F}$ be a pair of saturated fusion systems over finite $p$-groups $T \leq S$. Let $Z \leq Z(\mathcal{F})$ be a central subgroup. Then $Z\mathcal{E}$ is saturated, and $Z\mathcal{E} \leq \mathcal{F}$ if $\mathcal{E} \leq \mathcal{F}$.

**Proof.** A subgroup $P \leq ZT$ is fully normalized or fully centralized in $Z\mathcal{E}$ if and only if $P \cap T$ is fully normalized or fully centralized in $\mathcal{E}$. The saturation axioms for $Z\mathcal{E}$ follow easily from those for $\mathcal{E}$: note, for example, that $\text{Aut}_{Z\mathcal{E}}(P) \cong \text{Aut}_\mathcal{E}(P \cap T)$ for $P \leq ZT$. So $Z\mathcal{E}$ is saturated.
If $E \trianglelefteq F$, then the subgroup $ZT$ is strongly closed in $F$ since for each $x = zt$ (for $z \in Z$ and $t \in T$), each $\varphi \in \text{Hom}_F((x), S)$ extends to $\overline{\varphi} \in \text{Hom}_F(Z\langle t \rangle, S)$, and $\varphi(x) = z\overline{\varphi}(t) \in ZT$. The extension condition for $ZE$ follows directly from that for $E \trianglelefteq F$, and the invariance and Frattini conditions for $ZE$ follow from those conditions applied to $E \trianglelefteq F$ and the definition of a central subgroup. Thus $ZE \trianglelefteq F$.

The following lemma will also be useful.

**Lemma 1.22.** Let $F$ be a saturated fusion system over a finite $p$-group $S$, and let $E \trianglelefteq F$ be a normal fusion subsystem over $T \trianglelefteq S$. Let $Q \trianglelefteq S$ be a subgroup strongly closed in $F$, and assume that

1. each morphism in $F$ between subgroups of $T$ lies in $E$ (i.e., $E$ is a full subcategory of $F$), and
2. $S = QT$.

Then $Q \cap T$ is strongly closed in $E$ and $F/Q \cong E/(Q \cap T)$.

**Proof.** Since an intersection of strongly closed subgroups is strongly closed, $Q \cap T$ is strongly closed in $F$ and hence in $E$.

By (ii), the inclusion of $T$ into $S$ induces an isomorphism $\alpha: T/(Q \cap T) \xrightarrow{\cong} S/Q$. Then $\alpha(E/(Q \cap T)) \leq F/Q$ as fusion systems over $S/Q$, and we will show that they are equal.

Assume $\varphi \in \text{Hom}_F(P, R)$ for some $P, R \leq S$ containing $Q$, and set $\psi = \varphi|_{P\cap T}$ as a morphism from $P\cap T$ to $R\cap T$. Then $\psi \in \text{Hom}_E(P\cap T, R\cap T)$ by (i), and $\alpha(\psi/(Q\cap T)) = \varphi/Q$ as homomorphisms from $P/Q$ to $R/Q$. Thus $\varphi/Q \in \text{Mor}(\alpha(E/(Q \cap T)))$. Since $\varphi/Q \in \text{Mor}(F/Q)$ was arbitrary, this proves that $F/Q \leq \alpha(C_F(Q)/Z(Q))$. $\square$

## 2. Automorphism groups and tameness

The main aim of this section is to introduce the concept of tameness for fusion systems. This was originally defined in [AOV] and it is one of the main subjects of this article.

2.1. Automorphisms of fusion and linking systems. Before defining tameness, we must define automorphism and outer automorphism groups of fusion and linking systems.

**Definition 2.1.** Fix a saturated fusion system $F$ over a finite $p$-group $S$. Then

1. $\text{Aut}(F) = \{ \alpha \in \text{Aut}(S) \mid \alpha F = F \}$: the group of automorphisms of $S$ that send $F$ to itself;
2. $\text{Out}(F) = \text{Aut}(F)/\text{Aut}_F(S)$ is the group of outer automorphisms of $F$; and
3. for each $\alpha \in \text{Aut}(F)$, we let $c_\alpha: F \longrightarrow F$ denote the functor that sends an object $P$ to $\alpha(P)$ and a morphism $\varphi \in \text{Hom}_F(P, Q)$ to $\alpha \varphi \alpha^{-1} \in \text{Hom}_F(\alpha(P), \alpha(Q))$.

Now that we have defined automorphisms, we can define characteristic subsystems:

**Definition 2.2.** Fix a saturated fusion system $F$ over a finite $p$-group $S$. A fusion subsystem $E \leq F$ over $T \trianglelefteq S$ is characteristic if $E$ is normal in $F$ and $c_\alpha(E) = E$ for all $\alpha \in \text{Aut}(F)$. Likewise, a subgroup $P$ of $S$ is characteristic in $F$ if $P \trianglelefteq F$ and $\alpha(P) = P$ for all $\alpha \in \text{Aut}(F)$; equivalently, if $F_P(P)$ is a characteristic subsystem of $F$. 
For example, when \( \mathcal{F} \) is a saturated fusion system over a finite \( p \)-group \( S \), then the subsystems \( O^p(\mathcal{F}) \) and \( O^p(\mathcal{F}) \) (see Definition 1.14(b,c)) and the subgroups \( O_p(\mathcal{F}) \) and \( Z(\mathcal{F}) \) are all characteristic in \( \mathcal{F} \).

**Lemma 2.3.** Let \( \mathcal{E} \subseteq \mathcal{F} \) be a normal pair of fusion systems over finite \( p \)-groups \( T \subseteq S \). Then

(a) if \( \mathcal{D} \subseteq \mathcal{E} \) is characteristic in \( \mathcal{E} \), then \( \mathcal{D} \subseteq \mathcal{F} \); and
(b) \( O_p(\mathcal{E}) \leq O_p(\mathcal{F}) \).

**Proof.** Point (a) is shown in [A2, 7.4]. Since \( O_p(\mathcal{E}) \) is characteristic in \( \mathcal{E} \), \( O_p(\mathcal{E}) \subseteq \mathcal{F} \) by (a), and so \( O_p(\mathcal{E}) \leq O_p(\mathcal{F}) \), proving (b). \( \square \)

The following condition for a subnormal fusion system to be normal is due to Aschbacher.

**Lemma 2.4 ([A2, 7.4]).** Let \( \mathcal{D} \subseteq \mathcal{E} \subseteq \mathcal{F} \) be saturated fusion systems over finite \( p \)-groups \( U \subseteq T \subseteq S \) such that \( c_\alpha(\mathcal{D}) = \mathcal{D} \) for each \( \alpha \in \text{Aut}_T(T) \). Then \( \mathcal{D} \subseteq \mathcal{F} \).

The following definitions of automorphism groups are taken from [AOV, Definition 1.13 & Lemma 1.14]. Recall that for each pair of objects \( P \leq Q \) in a linking system \( (\mathcal{L}, \delta, \pi) \), we write \( \iota_{P,Q} = \delta_{P,Q}(1) \in \text{Mor}_\mathcal{L}(P, Q) \), and regard it as the “inclusion” in \( \mathcal{L} \) of \( P \) into \( Q \).

**Definition 2.5.** Let \( \mathcal{F} \) be a fusion system over a finite \( p \)-group \( S \) and let \( (\mathcal{L}, \delta, \pi) \) be an associated linking system. For each \( P \in \mathcal{L} \), we call \( \delta_P(P) \leq \text{Aut}_\mathcal{L}(P) \) the distinguished subgroup of \( \text{Aut}_\mathcal{L}(P) \).

(a) Let \( \text{Aut}(\mathcal{L}) \) be the group of automorphisms of the category \( \mathcal{L} \) that send inclusions to inclusions and distinguished subgroups to distinguished subgroups.

(b) For \( \gamma \in \text{Aut}_\mathcal{L}(S) \), let \( c_\gamma \in \text{Aut}(\mathcal{L}) \) be the automorphism which sends an object \( P \) to \( \gamma\gamma(P) \), and sends \( \psi \in \text{Mor}_\mathcal{L}(P, Q) \) to \( \gamma\gamma(\psi) = \gamma|_{Q,c_\gamma(Q)} \circ \gamma\gamma(\psi)|_{P,c_\gamma(P)}^{-1} \). Set
\[
\text{Out}(\mathcal{L}) = \text{Aut}(\mathcal{L})/\{c_\gamma \mid \gamma \in \text{Aut}_\mathcal{L}(S)\}.
\]

The notation in Definitions 2.1 and 2.5 is slightly different from that used in [AOV] and [AKO], as shown in the following table:

<table>
<thead>
<tr>
<th>Notation used here</th>
<th>( \text{Aut}(\mathcal{F}) )</th>
<th>( \text{Out}(\mathcal{F}) )</th>
<th>( \text{Aut}(\mathcal{L}) )</th>
<th>( \text{Out}(\mathcal{L}) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Used in [AOV, AKO]</td>
<td>( \text{Aut}(S, \mathcal{F}) )</td>
<td>( \text{Out}(S, \mathcal{F}) )</td>
<td>( \text{Aut}_{\text{typ}}(\mathcal{L}) )</td>
<td>( \text{Out}_{\text{typ}}(\mathcal{L}) )</td>
</tr>
</tbody>
</table>

By [AOV, Lemma 1.14], the above definition of \( \text{Out}(\mathcal{L}) \) is equivalent to \( \text{Out}_{\text{typ}}(\mathcal{L}) \) in [BLO2], and by [BLO2, Lemma 8.2], both are equivalent to \( \text{Out}_{\text{typ}}(\mathcal{L}) \) in [BLO1]. So by [BLO1, Theorem 4.5(a)], \( \text{Out}(\mathcal{L}_S^c(G)) \cong \text{Out}(BG_p^S) \): the group of homotopy classes of self homotopy equivalences of the space \( BG_p^S \).

The next result shows how an automorphism of a linking system automatically preserves the structure functors. For use in the next section, we state this for certain full subcategories of a linking system that need not themselves be linking systems because their objects might not be closed under overgroups. (Compare with Proposition 6 in [02].)

For a group \( G \), a set \( \mathcal{H} \) of subgroups of \( G \), and \( \beta \in \text{Aut}(G) \) that permutes the members of \( \mathcal{H} \), let \( \mathcal{T}(\beta) : \mathcal{T}_\mathcal{H}(G) \rightarrow \mathcal{T}_\mathcal{H}(G) \) denote the functor that sends \( H \in \mathcal{H} \) to \( \beta(H) \), and sends \( g \in T_G(H, K) \) to \( \beta(g) \in T_G(\beta(H), \beta(K)) \).

**Proposition 2.6.** Let \( (\mathcal{L}, \delta, \pi) \) be a linking system associated to a fusion system \( \mathcal{F} \) over a finite \( p \)-group \( S \), let \( \mathcal{L}_0 \subseteq \mathcal{L} \) be a full subcategory such that \( \text{Ob}(\mathcal{L}_0) \supseteq \mathcal{F}^c_r \), and let \( \text{Aut}(\mathcal{L}_0) \)
be the group of automorphisms of the category $\mathcal{L}_0$ that send inclusions to inclusions and distinguished subgroups to distinguished subgroups. Fix $\alpha \in \text{Aut}(\mathcal{L}_0)$, and let $\beta \in \text{Aut}(S)$ be the unique automorphism such that $\alpha(\delta_S(g)) = \delta_S(\beta(g))$ for all $g \in S$. Then $\beta \in \text{Aut}(\mathcal{F})$, $\alpha(P) = \beta(P)$ for each $P \in \text{Ob}(\mathcal{L}_0)$, and the following diagram of functors

\[
\begin{array}{ccc}
\mathcal{T}_{\text{Ob}(\mathcal{L}_0)}(S) & \overset{\delta}{\longrightarrow} & \mathcal{L}_0 \\
\tau(\beta) \downarrow & & \downarrow \alpha \\
\mathcal{T}_{\text{Ob}(\mathcal{L}_0)}(S) & \overset{\delta}{\longrightarrow} & \mathcal{L}_0 \\
\end{array}
\]

commutes.

**Proof.** Clearly, $\alpha(S) = S$, and hence $\alpha_\mathcal{S}$ sends $\delta_S(S) \in \text{Syl}_p(\text{Aut}_\mathcal{S}(S))$ to itself. Thus $\beta$ is well defined. Since $\alpha$ sends inclusions to inclusions, it commutes with restrictions. So for $P, Q \in \text{Ob}(\mathcal{L}_0)$ and $g \in T_S(P, Q)$ (the transporter set), we have

\[
\alpha(\delta_{P, Q}(g)) = \delta_{\alpha(P), \alpha(Q)}(\beta(g))
\]

since $\alpha(\delta_S(g)) = \delta_S(\beta(g))$. In particular, the left-hand square in (2.1) commutes.

When $Q = P$, (2.2) says that $\delta_{\alpha(P)}(\beta(P)) = \alpha_P(\delta_P(P))$, and $\alpha_P(\delta_P(P)) = \delta_{\alpha(P)}(\alpha(P))$ since $\alpha$ sends distinguished subgroups to distinguished subgroups. So $\alpha(P) = \beta(P)$ since $\delta_{\alpha(P)}$ is a monomorphism (Proposition 1.8(a)).

Fix $P, Q \in \text{Ob}(\mathcal{L})$ and $\psi \in \text{Mor}_\mathcal{L}(P, Q)$, and set $\varphi = \pi(\psi) \in \text{Hom}_\mathcal{F}(P, Q)$. For each $g \in P$, consider the following three squares:

\[
\begin{array}{ccc}
P & \overset{\psi}{\longrightarrow} & Q \\
\downarrow \delta_P(g) & & \downarrow \delta_Q(\varphi(g)) \\
P & \overset{\psi}{\longrightarrow} & Q
\end{array}
\quad \begin{array}{ccc}
\alpha(P) & \overset{\alpha(\psi)}{\longrightarrow} & \alpha(Q) \\
\downarrow \delta_{\alpha(P)}(\beta(g)) & & \downarrow \delta_{\alpha(Q)}(\beta(\varphi(g))) \\
\alpha(P) & \overset{\alpha(\psi)}{\longrightarrow} & \alpha(Q)
\end{array}
\quad \begin{array}{ccc}
\alpha(P) & \overset{\alpha(\psi)}{\longrightarrow} & \alpha(Q) \\
\downarrow \delta_{\alpha(P)}(\beta(g)) & & \downarrow \delta_{\alpha(Q)}(\beta(\varphi(g))) \\
\alpha(P) & \overset{\alpha(\psi)}{\longrightarrow} & \alpha(Q)
\end{array}
\]

The first and third of these squares commute by axiom (C) in Definition 1.7, and the second commutes since it is the image under $\alpha$ of the first. Since morphisms in $\mathcal{L}$ are epimorphisms and $\delta_{\alpha(Q)}$ is injective (Proposition 1.8(a,b)), this implies $\beta(\varphi(g)) = \pi(\alpha(\psi)) = \pi(\beta(\varphi(g)))$. Thus $\varphi(\psi) = \beta \varphi \beta^{-1} = c_\beta(\pi(\psi))$, proving that the right-hand square in (2.1) commutes.

In particular, since $\pi$ is surjective on morphism sets (axiom (A2) in Definition 1.7), $\beta \varphi \beta^{-1} \in \text{Hom}_\mathcal{F}(\beta(P), \beta(Q))$ for each $P, Q \in \text{Ob}(\mathcal{L}_0)$ and each $\varphi \in \text{Hom}_\mathcal{F}(P, Q)$. Since $\text{Ob}(\mathcal{L}_0)$ includes all subgroups which are $\mathcal{F}$-centric and $\mathcal{F}$-radical, all morphisms in $\mathcal{F}$ are composites of restrictions of morphisms between objects of $\mathcal{L}_0$ by Theorem 1.4. Hence $\beta \mathcal{F} \leq \mathcal{F}$ with equality since $\mathcal{F}$ is a finite category, and so $\beta \in \text{Aut}(\mathcal{F})$.

**Proposition 2.6** motivates the following definition.

**Definition 2.7.** Let $(\mathcal{L}, \delta, \pi)$ be a linking system associated to a fusion system $\mathcal{F}$ over a finite $p$-group $S$. Let $\tilde{\mu}_\mathcal{L}: \text{Aut}(\mathcal{L}) \longrightarrow \text{Aut}(\mathcal{F})$ denote the homomorphism that sends $\alpha \in \text{Aut}(\mathcal{L}_0)$ to $\beta \in \text{Aut}(\mathcal{F})$ such that diagram (2.1) commutes. Let $\mu_\mathcal{L}: \text{Out}(\mathcal{L}) \longrightarrow \text{Out}(\mathcal{F})$ be the induced homomorphisms on the quotient groups.

That $\tilde{\mu}_\mathcal{L}$ is a homomorphism follows easily from its definition via diagram (2.1). For $\gamma \in \text{Aut}(\mathcal{L}(S))$, we have $\tilde{\mu}_\mathcal{L}(c_\gamma) = \pi(\gamma) \in \text{Out}_\mathcal{F}(S)$ since $\pi$ is a functor, so $\mu_\mathcal{L}$ is well defined.
2.2. Tameness of fusion systems. We next define a homomorphism $\kappa_G$ that connects the automorphisms of a group to those of its linking system. We refer to [AOV, §2.2] for more details about $\kappa_G$ and the proof that it is well defined.

**Definition 2.8.** Let $G$ be a finite group and choose $S \in \text{Syl}_p(G)$. Let

$$\kappa_G : \text{Out}(G) \longrightarrow \text{Out}(\mathcal{L}_S^e(G))$$

denote the homomorphism that sends the class of $\alpha \in \text{Aut}(G)$ such that $\alpha(S) = S$ to the class of the automorphism of $\mathcal{L}_S^e(G)$ induced by $\alpha$.

In these terms, tameness can be defined as follows.

**Definition 2.9.** Let $\mathcal{F}$ be a saturated fusion system over a finite $p$-group $S$. Then

(a) $\mathcal{F}$ is tamely realized by a finite group $G$ if $\mathcal{F} \cong \mathcal{F}^*_{\mathcal{F}^*}(G)$ for some $S^* \in \text{Syl}_p(G)$ and the homomorphism $\kappa_G : \text{Out}(G) \longrightarrow \text{Out}(\mathcal{L}_S^e(G))$ is split surjective; and

(b) $\mathcal{F}$ is tame if it is tamely realized by some finite group.

2.3. Centric fusion and linking subsystems. Some of the results in later sections need the hypothesis that a certain fusion or linking subsystem be centric, which we now define.

**Definition 2.10.** Let $\mathcal{E} \trianglelefteq \mathcal{F}$ be a normal pair of saturated fusion systems over finite $p$-groups $T \trianglelefteq S$.

(a) Let $C_S(\mathcal{E})$ denote the unique largest subgroup $X \leq C_S(T)$ such that $C_\mathcal{F}(X) \geq \mathcal{E}$. Such a largest subgroup exists by [A2, 6.7], or (via a different proof) by [He2, Theorem 1(a)].

(b) The subsystem $\mathcal{E}$ is centric in $\mathcal{F}$ if $C_S(\mathcal{E}) \leq T$; i.e., if there is no $x \in C_S(T) \setminus T$ such that $C_\mathcal{F}(x) \geq \mathcal{E}$.

(c) If $\mathcal{M} \trianglelefteq \mathcal{L}$ are linking systems associated to $\mathcal{E} \trianglelefteq \mathcal{F}$, set

$$C_{\text{Aut}_\mathcal{L}(T)}(\mathcal{M}) = \{ \gamma \in \text{Aut}_\mathcal{L}(T) \mid c_\gamma = \text{Id}_\mathcal{M} \}$$

where $c_\gamma$ is a well defined element of $\text{Aut}(\mathcal{M})$ by Definition 1.12.(b).

(d) If $\mathcal{M} \trianglelefteq \mathcal{L}$ are linking systems associated to $\mathcal{E} \trianglelefteq \mathcal{F}$, then $\mathcal{M}$ is centric in $\mathcal{L}$ if $C_{\text{Aut}_\mathcal{L}(T)}(\mathcal{M}) \leq \text{Aut}_\mathcal{M}(T)$; equivalently, if $c_\psi \neq \text{Id}_\mathcal{M}$ for each $\psi \in \text{Aut}_\mathcal{L}(T) \setminus \text{Aut}_\mathcal{M}(T)$.

For pairs of linking systems, this is the definition used in [AOV] (Definition 1.27). The term “centric fusion subsystem” was not used in [O4], but the condition in Definition 2.10(b) appears in Proposition 2.1 and Theorem 2.3 of that paper (and the term is used in [O4c]).

In the next lemma, we look at the relation between normal centric fusion subsystems and normal centric linking subsystems.

**Lemma 2.11.** Let $\mathcal{E} \trianglelefteq \mathcal{F}$ be a normal pair of saturated fusion systems over finite $p$-groups $T \trianglelefteq S$ with associated linking systems $\mathcal{M} \trianglelefteq \mathcal{L}$, and set

$$C_S(\mathcal{M}) = \{ x \in S \mid c_\delta_T(x) = \text{Id}_\mathcal{M} \} \trianglelefteq S.$$

Then

(a) $C_{\text{Aut}_\mathcal{L}(T)}(\mathcal{M}) = \delta_T(C_S(\mathcal{M}))$ and $Z(\mathcal{E})Z(\mathcal{F}) \leq C_S(\mathcal{M}) \leq C_S(\mathcal{E})$;

(b) $\mathcal{M}$ is centric in $\mathcal{L}$ if and only if $C_S(\mathcal{M}) \leq T$, and this holds if $\mathcal{E}$ is centric in $\mathcal{F}$; and

(c) the conjugation action of $\text{Aut}_\mathcal{L}(T)$ on $C_S(\mathcal{M}) \cong \delta_T(C_S(\mathcal{M})) \leq \text{Aut}_\mathcal{L}(T)$ induces an action of the quotient group $\mathcal{L}/\mathcal{M} = \text{Aut}_\mathcal{L}(T)/\text{Aut}_\mathcal{M}(T)$ on $C_S(\mathcal{M})$, and $C_{\text{Aut}_\mathcal{M}(T)}(\mathcal{L}/\mathcal{M}) = Z(\mathcal{F})$. 

Proof. Throughout the proof, “axiom (−)” always refers to one of the axioms in the definition of a linking system (Definition 1.7).

We first claim that

$$\forall x \in S, \quad \delta_T(x) \in \text{Aut}_M(T) \iff x \in T. \quad (2.3)$$

The implication “$$\iff$$” is clear. To see the converse, fix $x \in S$ such that $\delta_T(x) \in \text{Aut}_M(T)$. Then $c_x \in \text{Aut}_\mathcal{L}(T)$, and $c_x \in \text{Im}(T) \subseteq \text{Syl}_p(\text{Aut}_\mathcal{L}(T))$ since it has $p$-power order. Thus there is $t \in T$ such that $xt^{-1} \in C_S(T)$, $\delta_T(xt^{-1}) = \delta_T(x)\delta_T(t)^{-1} \in \text{Aut}_M(T)$, and so $xt^{-1} \in Z(T)$ by axiom (A2) applied to $\mathcal{M}$ and since $\delta_T$ is injective (Proposition 1.8(a)). Hence $x \in T$.

We next claim that

$$C_S(\mathcal{E}) \cap T = Z(\mathcal{E}). \quad (2.4)$$

The inclusion $Z(\mathcal{E}) \leq C_S(\mathcal{E}) \cap T$ is immediate from the definitions. If $x \in C_S(\mathcal{E}) \cap T \leq Z(T)$, then since $\mathcal{E} \leq C_T(x)$, each $\varphi \in \text{Hom}_\mathcal{E}(\langle x \rangle, S)$ extends to a morphism in $\mathcal{F}$ that sends $x$ to itself, and hence $\varphi(x) = x$. Thus $x^\varphi = \{x\}$, so $x \in Z(\mathcal{E})$ by [AKO, Lemma I.4.2], finishing the proof of (2.4).

(a) Fix $\alpha \in C_{\text{Aut}_\mathcal{L}(T)}(\mathcal{M})$. By axiom (C) for the linking system $\mathcal{L}$, for all $g \in T$, $\alpha\delta_T(g)\alpha^{-1} = \delta_T(\pi(\alpha)(g))$, so $\delta_T(g) = \delta_T(\pi(\alpha)(g))$ since $\alpha = \text{Id}_M$, and $g = \pi(\alpha)(g)$ since $\delta_T$ is injective (see Proposition 1.8(a)) So $\pi(\alpha) = \text{Id}_T$, and $\alpha = \delta_T(x)$ for some $x \in C_S(\mathcal{E})$ by axiom (A2). Then $x \in C_S(\mathcal{M})$ by definition, and thus $C_{\text{Aut}_\mathcal{L}(T)}(\mathcal{M}) = \delta_T(C_S(\mathcal{M}))$.

If $x \in Z(\mathcal{E}) = C_S(\mathcal{E}) \cap T$, then for each $P, Q \leq T$ and $\psi \in \text{Mor}_\mathcal{M}(P, Q)$, $\pi(\psi)$ extends to some $\overline{\varphi} \in \text{Hom}_\mathcal{E}(P(x), Q(x))$, and $\overline{\varphi} = \pi(\overline{\psi})$ for some $\overline{\psi} \in \text{Mor}_\mathcal{M}(P(x), Q(x))$. Set $\psi' = \overline{\psi}|_{P-Q} \in \text{Mor}_\mathcal{M}(P, Q)$, then $\psi'\delta_T(x) = \delta_Q(x)\psi'$ since $\psi\delta_T(x) = \delta_T(x)\psi$ by axiom (C). Also, $\overline{\psi}(\psi') = \pi(\psi')$, so if $P$ is fully centralized in $\mathcal{E}$, then $\psi' = \psi\delta_T(y)$ for some $y \in C_T(P)$. Then $[x, y] = 1$ since $x \in Z(T)$, so $c_{\delta_T(x)}(\delta_T(y)) = \delta_T(y)$, and thus $c_{\delta_T(x)}(\psi) = \psi$. This holds for all $\psi \in \text{Mor}(\mathcal{M})$ whose domain is fully centralized, and hence for all morphisms in $\mathcal{M}$. So $x \in C_T(\mathcal{M}) \leq C_S(\mathcal{E})$.

Thus $Z(\mathcal{E}) \leq C_S(\mathcal{M})$. By a similar argument but working in $\mathcal{L}$ and $\mathcal{F}$ instead of $\mathcal{M}$ and $\mathcal{E}$, we also have $Z(\mathcal{F}) \leq C_S(\mathcal{L}) \leq C_S(\mathcal{M})$, and so $Z(\mathcal{E})Z(\mathcal{F}) \leq C_S(\mathcal{M})$.

It remains to show that $C_S(\mathcal{M}) \leq C_S(\mathcal{E})$. Fix $x \in C_S(\mathcal{M})$; we must show that $\mathcal{E} \leq C_T(x)$. Fix $P, Q \leq T$ and $\varphi \in \text{Hom}_\mathcal{E}(P, Q)$, and choose $\psi \in \text{Mor}_\mathcal{M}(P, Q)$ such that $\pi(\psi) = \varphi$. Set $\overline{P} = P(x)$ and $\overline{Q} = Q(x)$. Then $\psi\delta_T(x) = \delta_Q(x)\psi$ since $c_{\delta_T(x)} = \text{Id}_M$, and $\psi\delta_T(g) = \delta_Q(\varphi(g))\psi$ for all $g \in P$ by axiom (C) applied to $\mathcal{M}$. So for each $g \in \overline{P}$, there is $h \in \overline{Q}$ such that $\psi\delta_T(g) = \delta_Q(h)\psi$ in $\text{Mor}_\mathcal{F}(P, Q)$, and by Proposition 1.8(d), $\psi$ extends to a unique morphism $\overline{\psi} \in \text{Mor}_\mathcal{F}(\overline{P}, \overline{Q})$. Set $\overline{\varphi} = \pi(\overline{\psi}) \in \text{Hom}_\mathcal{F}(\overline{P}, \overline{Q})$. By axiom (C) again (but applied to $\mathcal{L}$) we have $\psi\delta_T[p(x)] = \delta_Q[p(\overline{\varphi}(x))]\psi$, and after restriction to $P$ and $Q$ this gives $\psi\delta_T[p(x)] = \delta_Q[p(\overline{\varphi}(x))]\psi$. Hence $\delta_Q[p(\overline{\varphi}(x))] = \varphi(x)\psi$, so $\delta_Q[p(\overline{\varphi}(x))] = \delta_T(x) \psi$ since $\psi$ is an epimorphism in the categorical sense (see Proposition 1.8(b)), and $\overline{\varphi}(x) = x$ by the injectivity of $\delta_Q$. Thus each morphism in $\mathcal{E}$ extends to a morphism in $\mathcal{F}$ that sends $x$ to itself, and hence $C_T(x) \geq \mathcal{E}$ and $x \in C_S(\mathcal{E})$.

(b) By (a) and Definition 2.10(c), $\mathcal{M}$ is centric in $\mathcal{L}$ if and only if $\delta_T(C_S(\mathcal{M})) \leq \text{Aut}_\mathcal{M}(T)$, and this holds exactly when $C_S(\mathcal{M}) \leq T$ by (2.3). Since $C_S(\mathcal{M}) \leq C_S(\mathcal{E})$ by (a), this is the case whenever $\mathcal{E}$ is centric in $\mathcal{F}$.

(c) By (a), $\delta_T(C_S(\mathcal{M}))$ is the kernel of the homomorphism from $\text{Aut}_\mathcal{L}(T)$ to $\text{Aut}(\mathcal{M})$ induced by conjugation. So $\delta_T(C_S(\mathcal{M})) \leq \text{Aut}_\mathcal{L}(T)$, and $\text{Aut}_\mathcal{L}(T)$ acts by conjugation on $C_S(\mathcal{M}) \cong \delta_T(C_S(\mathcal{M}))$. Since this subgroup centralizes $\mathcal{M}$ by definition, $\text{Aut}_\mathcal{M}(T)$ acts
trivially, and hence the action of Aut_L(T) factors through an action of the quotient group L/M.

By Definitions 1.3(g) and 2.10(a), Z(\mathcal{F}) = C_S(\mathcal{F}). So by (a) applied when \mathcal{M} = \mathcal{L},

\[ C_{\text{Aut}_L(S)}(\mathcal{L}) = \delta_S(Z(\mathcal{F})). \]

(2.5)

Thus for each \( x \in Z(\mathcal{F}) \), \( \delta_S(x) \) acts trivially on \( \mathcal{L} \) and hence \( \delta_T(x) \) acts trivially on \( \text{Aut}_L(T) \). So \( Z(\mathcal{F}) \leq C_{\text{Aut}_L(S)}(\mathcal{L}) = \delta_S(Z(\mathcal{F})). \)

Thus it remains to prove the opposite inclusion.

Fix \( x \in C_S(\mathcal{M}) \) such that \( \delta_T(x) \in Z(\text{Aut}_L(T)) \). In particular, \( \delta_T(x) \in Z(\delta_T(S)) \), so \( x \in Z(S) \) by the injectivity of \( \delta_T \) (Proposition 1.8(a)), and \( c_{\delta_T(x)}(P) = 0P = 0P \) for each \( P \in \text{Ob}(\mathcal{L}) \). We must show that \( \delta_T(x) \) acts trivially on \( \mathcal{L} \). Fix \( P, Q \leq S \) and \( \psi \in \text{Mor}_\mathcal{L}(P, Q) \), and set \( P_0 = P \cap T, Q_0 = Q \cap T \), and \( \psi_0 = \psi|_{P_0 Q_0} \) (see Proposition 1.8(c)). By the Frattini condition on a normal linking subsystem (Lemma 1.13), \( \psi_0 \) is the composite of the restriction of a morphism \( \gamma \in \text{Aut}_L(T) \) followed by some \( \chi \in \text{Mor}(\mathcal{M}) \). Since \( \delta_T(x) \) commutes with \( \gamma \) by assumption and commutes with \( \chi \) by (a) \( (Z(\mathcal{F}) \leq C_S(\mathcal{M})) \), we have

\[
(\psi \delta_P(x))|_{P_0 Q_0} = \psi_0 \delta_P(x) = \delta_{Q_0}(x) \psi_0 = (\delta_Q(x) \psi)|_{P_0 Q_0}.
\]

Then \( \psi \delta_P(x) = \delta_Q(x) \psi \) by the uniqueness of extensions in a linking system (Proposition 1.8(d)), and hence \( c_{\delta_T(x)}(\psi) = \psi \).

Thus \( c_{\delta_T(x)} \) is the identity on all objects and morphisms in \( \mathcal{L} \). So \( x \in Z(\mathcal{F}) \) by (2.5) and the injectivity of \( \delta_S \) (Proposition 1.8(a)).

The following consequence of Lemma 2.11 will be needed in Section 4.

**Lemma 2.12.** Let \( H \leq G \) be finite groups, choose \( S \in \text{Syl}_p(G) \), and set \( T = S \cap H \). Set \( \mathcal{F} = \mathcal{F}_S(G) \) and \( \mathcal{E} = \mathcal{F}_T(H) \leq \mathcal{F} \). If \( \text{Ker}(\kappa_H) \) has order prime to \( p \), then \( Z(\mathcal{F}) \leq Z(\mathcal{E}) C_S(H) \).

**Proof.** Set \( G_0 = SH \) and \( \mathcal{F}_0 = \mathcal{F}_S(G_0) \), and set \( \mathcal{H} = \{ P \leq S \mid P \cap T \in \mathcal{E} \} \). For each \( P \in \mathcal{H} \), \( C_H(P \cap H) = Z(P \cap H) \times O_p'(C_H(P \cap H)) \) since \( P \cap H \in \mathcal{E} \), so \( C_H(P) = (Z(P) \cap H) \times O_p'(C_H(P)) \), and this has \( p \)-power index in \( C_{G_0}(P) \). Thus \( O^p(C_{G_0}(P)) \) has order prime to \( p \), so \( P \) is \( \mathcal{F}_0^p \)-quasicentric by [AKO, Lemma III.4.6(e)].

Thus \( \mathcal{H} \subseteq \mathcal{F}_0^p \). Let \( \mathcal{L}_0 = \mathcal{L}_S^H(G_0) \) (see [AKO, p. 146]), and \( \mathcal{M} = \mathcal{L}_T^H(H) \). Then \( \mathcal{M} \leq \mathcal{L}_0 \) is a normal pair of linking systems associated to \( \mathcal{E} \leq \mathcal{F}_0 \), so by Lemma 2.11(a),

\[
Z(\mathcal{F}_0) \leq C_S(\mathcal{M}) = \{ x \in S \mid c_{\delta_T}(x) = 1d_{\mathcal{M}} \}. \tag{2.6}
\]

Fix \( x \in Z(\mathcal{F}) \leq Z(\mathcal{F}_0) \). By (2.6), \( [c_x] \in \text{Ker}(\kappa_H) \), and so \( c_x \in \text{Inn}(H) \) since \( \text{Ker}(\kappa_H) \) has order prime to \( p \). Thus \( c_x \) is conjugation by some element \( y \in C_H(T) = Z(T) \times O_p'(C_H(T)) \), and since \( c_x \) has \( p \)-power order, we can assume \( y \in Z(T) \). Then \( c_y \) induces the identity on \( \mathcal{M} \) since \( c_x \) does by (2.6), so \( y \in Z(\mathcal{E}) \) by the exact sequence in [AOV, Lemma 1.14(a)]. Also, \( y^{-1} x \in C_S(H) \), and so \( x \in Z(\mathcal{E}) C_S(H) \).}

\[ \square \]

### 3. Products of fusion and linking systems

In this section, we first define centric linking systems associated to products of two or more fusion systems (Lemma 3.5). This is followed by a description of the group of automorphisms of such a product linking systems that leave the factors invariant up to permutation, as well as conditions on the fusion systems that guarantee that these are the only automorphisms of the linking system (Proposition 3.7(a,b)). As a consequence, we show that a product of tame fusion systems that satisfy these same conditions is always tame (Proposition 3.7(c)).
Recall that if $\mathcal{F}_1$ and $\mathcal{F}_2$ are fusion systems over finite $p$-groups $S_1$ and $S_2$, then $\mathcal{F}_1 \times \mathcal{F}_2$ is the fusion system over $S_1 \times S_2$ generated by all morphisms $\varphi_1 \times \varphi_2 \in \text{Hom}(P_1 \times P_2, Q_1 \times Q_2)$ for $\varphi_i \in \text{Hom}_{\mathcal{F}_i}(P_i, Q_i)$ ($i = 1, 2$). See [AKO, Definition I.6.5] for more details. When $\mathcal{F}_1$ and $\mathcal{F}_2$ are both saturated, then so is $\mathcal{F}_1 \times \mathcal{F}_2$ [AKO, Theorem I.6.6].

The following notation and hypotheses will be used throughout the section.

**Hypotheses 3.1.** Let $\mathcal{F}_1, \ldots, \mathcal{F}_k$ be saturated fusion systems over finite $p$-groups $S_1, \ldots, S_k$ (some $k \geq 2$), and set $S = S_1 \times \cdots \times S_k$ and $\mathcal{F} = \mathcal{F}_1 \times \cdots \times \mathcal{F}_k$. For each $i$, let $\text{pr}_i : S \to S_i$ be the projection. For each $P \leq S$, we write $P_i = \text{pr}_i(P)$ (for $1 \leq i \leq k$) and $\hat{P} = P_1 \times \cdots \times P_k \leq S$. Thus $\hat{P} \geq P$ for each $P$.

We first check which subgroups are centric in a product of fusion systems.

**Lemma 3.2.** Assume Hypotheses 3.1. Then a subgroup $P \leq S$ is $\mathcal{F}$-centric if and only if $P_i$ is $\mathcal{F}_i$-centric for all $i$ and $Z(P_1) \times \cdots \times Z(P_k) \leq P$.

**Proof.** For each $P \leq S$, we have $C_S(P) = C_{S_1}(P_1) \times \cdots \times C_{S_k}(P_k) = C_S(\hat{P})$. Hence

- $P$ is fully centralized in $\mathcal{F}$ if and only if $P_i$ is fully centralized in $\mathcal{F}_i$ for each $i$, and
- $C_S(P) \leq P$ if and only if $C_{S_i}(P_i) \leq P_i$ for each $i$ and $Z(\hat{P}) \leq P$.

The result now follows since $P$ is $\mathcal{F}$-centric if and only if $P$ is fully centralized in $\mathcal{F}$ and $C_S(P) \leq P$. □

Note also that under Hypotheses 3.1, if $P \leq S$ is $\mathcal{F}$-centric and $\mathcal{F}$-radical, then $P = \hat{P} = P_1 \times \cdots \times P_k$ (see, e.g., [AOV, Lemma 3.1]). But that will not be needed here.

The following easy consequence of the Krull-Remak-Schmidt theorem will be needed. Recall that a group is indecomposable if it is not the direct product of two of its proper subgroups.

**Proposition 3.3.** Assume $G_1, \ldots, G_k$ are finite, indecomposable groups, and set $G = G_1 \times \cdots \times G_k$. Then the following hold for each $\alpha \in \text{Aut}(G)$.

(a) There is $\sigma \in \Sigma_k$ such that $\alpha(G_i Z(G)) = G_{\sigma(i)}Z(G)$ for each $1 \leq i \leq k$.

(b) If $(|Z(G)|, |G/[G,G]|) = 1$, then there is $\sigma \in \Sigma_k$ such that $\alpha(G_i) = G_{\sigma(i)}$ for each $i$.

**Proof.** An automorphism $\beta \in \text{Aut}(\hat{G})$ is normal if $\beta$ commutes with all inner automorphisms of $G$; equivalently, if $[\beta, G] \leq Z(G)$. For such $\beta$, one can define a homomorphism $\delta : G \to Z(G)$ by setting $\delta(g) = \beta(g)g^{-1}$, and $\delta$ factors through $G/[G,G]$. In particular, if $(|Z(G)|, |G/[G,G]|) = 1$, then the only normal automorphism of $G$ is the identity.

By the Krull-Remak-Schmidt theorem in the form stated in [Sz1, Theorem 2.4.8] (and applied with $\Omega = 1$ or $\Omega = \text{Inn}(G)$), any two direct product decompositions of $G$ with indecomposable factors have the same number of factors, and there is always a normal automorphism of $G$ that sends one to the other up to a permutation of the factors. Points (a) and (b) follow immediately from this, applied to the decompositions of $G$ as the product of the $G_i$ and of the $\alpha(G_i)$. □

One immediate consequence of Proposition 3.3 is the following description of $\text{Out}(G)$ when $G$ is a product of simple groups.

**Proposition 3.4.** Assume $G = G_1 \times \cdots \times G_k$, where $G_1, \ldots, G_k$ are finite indecomposable groups and $(|Z(G)|, |G/[G,G]|) = 1$. Let $\Gamma$ be the group of all $\gamma \in \Sigma_k$ such that $G_{\gamma(i)} \cong G_i$.
Let $G$ are the $F$-system associated to $P, Q$. Define $\Phi$ with the property that $\Phi(G) = (\lambda)_{i,j} \in \text{Inn}(G_i)$ isomorphically to $\text{Inn}(G)$, and hence induces an isomorphism $\Phi_G: (\text{Out}(G_1) \times \cdots \times \text{Out}(G_k)) \times \Gamma \xrightarrow{\cong} \text{Out}(G)$.

To define $\Phi_G$ more precisely, fix isomorphisms $\lambda_{ij}: G_i \to G_j$ for each $1 \leq i < j \leq k$ such that $G_i \cong G_j$, chosen so that $\lambda_{ii} = \lambda_{ji}$ whenever $G_i \cong G_j \cong G_i$, and set $\lambda_{ij} = \lambda_{ij}^{-1}$. Also, set $\lambda_{ii} = \text{Id}_{G_i}$ for each $i$. Then $\Phi_G$ can be chosen so that for each $\gamma \in \Gamma$, $\Phi_G(\gamma)(g_1, \ldots, g_k) = (\lambda_{\gamma^{-1}(1),1}(g_{\gamma^{-1}(1)}), \ldots, \lambda_{\gamma^{-1}(k),k}(g_{\gamma^{-1}(k)}))$.

**Proof.** Without loss of generality, we can assume that $G_i = G_j$ and $\lambda_{ij} = \text{Id}_{G_i}$ for each $i, j$ such that $G_i \cong G_j$. Thus $\Phi_G(\gamma)(g_1, \ldots, g_k) = (g_{\gamma^{-1}(1)}, \ldots, g_{\gamma^{-1}(k)})$ for each $\gamma \in \Gamma$. Then $\Phi_G$ is clearly an injective homomorphism, and it factors through a homomorphism $\overline{\Phi}_G$ as above since $\text{Inn}(G) = \Phi_G(\prod_{i=1}^k \text{Inn}(G_i))$. Each automorphism of $G$ permutes the factors by Proposition 3.3(b), and hence $\Phi_G$ is surjective. $\square$

In the next proposition, we describe one way to construct linking systems associated to products of fusion systems.

**Proposition 3.5.** Assume Hypotheses 3.1. For each $1 \leq i \leq k$, let $L_i$ be a centric linking system associated to $F_i$, with structure functors $\delta_i$ and $\pi_i$. Let $L$ be the category whose objects are the $F$-centric subgroups of $S$, and where for each $P, Q \in \text{Ob}(L)$, $\text{Mor}_L(P, Q) = \{(\varphi_1, \ldots, \varphi_k) \in \prod_{i=1}^k \text{Mor}_{L_i}(P_i, Q_i) \mid (\pi_1(\varphi_1), \ldots, \pi_k(\varphi_k))(P) \leq Q\}$. Define $\tau_{\text{Ob}(L)}(S) \xrightarrow{\delta} L \xrightarrow{\pi} F$ by setting, for all $P, Q \in F^c = \text{Ob}(L)$,

$\delta_{P,Q}(g) = ((\delta_1)_{P,Q_1}(g_1), \ldots, (\delta_k)_{P,Q_k}(g_k))$ all $g = (g_1, \ldots, g_k) \in T_S(P, Q)$

$\pi_{P,Q}(\varphi) = (\pi_1(\varphi_1), \ldots, \pi_k(\varphi_k))$ all $\varphi = (\varphi_1, \ldots, \varphi_k) \in \text{Mor}_L(P, Q)$.

Then the following hold:

(a) The functors $\delta$ and $\pi$ make $L$ into a centric linking system associated to $F$.

(b) Let $L_1 \times \cdots \times L_k$ be the product of the categories $L_i$. Define $\xi_L: L_1 \times \cdots \times L_k \to L$ by setting $\xi_L(P_1, \ldots, P_k) = P_1 \times \cdots \times P_k$ and $\xi_L(\varphi_1, \ldots, \varphi_k) = (\varphi_1, \ldots, \varphi_k)$. Then $\xi_L$ is an isomorphism of categories from $L_1 \times \cdots \times L_k$ to the full subcategory $\hat{L} \subseteq L$ whose objects are those $P \in F^c$ such that $P = \hat{P}$; equivalently, the products $P_1 \times \cdots \times P_k$ for $P_i \in F^c_i$. Also, the following square commutes

$\tau_{\text{Ob}(L_1)}(S_1) \times \cdots \times \tau_{\text{Ob}(L_k)}(S_k) \xrightarrow{\eta} \tau_{\text{Ob}(\hat{L})}(S)$

$\delta$

where $\eta$ is the natural isomorphism that sends $(P_1, \ldots, P_k)$ to $\prod_{i=1}^k P_i$.\]
(c) Let $\rho_i: \mathcal{L}_i \to \mathcal{L}$ be the functor that sends $P_i \in \text{Ob}(\mathcal{L}_i)$ to its product with the $S_j$ for $j \neq i$, and sends $\varphi_i \in \text{Mor}(\mathcal{L}_i)$ to its product with $\text{Id}_{S_j}$ for $j \neq i$. Then $\rho_i$ is injective on objects and on morphism sets. If $\alpha \in \text{Aut}(\mathcal{L})$ is such that $\alpha(S_i) = S_i$ for each $i$, then $\alpha(\rho_i(\mathcal{L}_i)) = \rho_i(\mathcal{L}_i)$ for each $i$.

**Proof.** By Lemma 3.2, for each $P \in \text{Ob}(\mathcal{L}) = \mathcal{F}$, $\text{pr}_i(P)$ is $\mathcal{F}_i$-centric for each $i$. So the definitions of $\text{Mor}(\mathcal{P}, \mathcal{Q})$ and $\delta$ make sense.

(a) Axiom (A1) is clear. Fix $P, Q \in \text{Ob}(\mathcal{L})$ and set $P_i = \text{pr}_i(P)$ and $Q_i = \text{pr}_i(Q)$; then $C_S(P) = Z(P) = Z(P_1) \times \cdots \times Z(P_k)$. So by axiom (A2) for the $\mathcal{L}_i$, for $\varphi, \varphi' \in \text{Mor}(\mathcal{P}, \mathcal{Q})$, $\pi(\varphi) = \pi(\varphi')$ if and only if $\varphi' = \varphi \circ \delta(z)$ for some $z \in Z(P)$. For each $P, Q \in \text{Ob}(\mathcal{L})$, each $\varphi \in \text{Hom}(\mathcal{P}, \mathcal{Q})$ is the restriction of some morphism $\prod_{i=1}^k \varphi_i \in \text{Hom}_F(\hat{P}, \hat{Q})$ (see [AKO, Theorem I.6.6]), and hence the surjectivity of $\pi$ on morphism sets follows from that of the $\pi_i$. The rest of (A2) (the effect of $\varphi$ and $\pi$ on objects) is clear. Likewise, axioms (B) and (C) for $\mathcal{L}$ follow immediately from the corresponding axioms for the $\mathcal{L}_i$. Thus $\mathcal{L}$ is a centric linking system with structure functors $\delta$ and $\pi$.

(b) Both statements ($\xi_\mathcal{L}$ is an isomorphism of categories and the diagram commutes) are immediate from the definitions and since $P_1 \times \cdots \times P_k$ is $F$-centric if $P_i$ is $F_i$-centric for each $i$ (Lemma 3.2).

(c) Let $\alpha \in \text{Aut}(\mathcal{L})$ be such that $\alpha(S_i) = S_i \leq \text{Aut}(\mathcal{L})(S)$ for each $i$. We must show that $\alpha(\rho_i(\mathcal{L}_i)) = \rho_i(\mathcal{L}_i)$ for each $i$. Fix some $i$, let $\bar{S}_i \leq S$ be the product of the $S_j$ for $j \neq i$, and identify $S_i \times \bar{S}_i$ with $S$. Thus $\rho_i(P_i) = P_i \times \bar{S}_i$ and $\rho_i(\varphi_i) = (\varphi_i \times \text{Id}_{\bar{S}_i})$ for $P_i \in \text{Ob}(\mathcal{L}_i)$ and $\varphi_i \in \text{Mor}(\mathcal{L}_i)$.

Set $\beta = \bar{\mu}_\mathcal{L}(\alpha) \in \text{Aut}(\mathcal{F})$ (see Definition 2.7). By Proposition 2.6, $\alpha(P) = \beta(P)$ for $P \in \text{Ob}(\mathcal{L})$, and $\pi \circ \alpha = c_\beta \circ \pi$ as functors from $\mathcal{L}$ to $\mathcal{F}$. By assumption, $\beta(S_i) = S_i$ and $\beta(\bar{S}_i) = S_i$. So for each $P_i \in \text{Ob}(\mathcal{L}_i)$, we have $\alpha(\rho_i(P_i)) = \beta(P_i \times \bar{S}_i) = P_i^\ast \times S_i$ for some $P_i^\ast \leq S_i$. Thus $\alpha$ permutes the objects in $\rho_i(\mathcal{L}_i)$.

Now fix a morphism $\varphi_i \in \text{Mor}(\mathcal{L}_i, P_i, Q_i)$. Since $\pi \circ \alpha = c_\beta \circ \pi$, we have

$$\pi(\alpha(\rho_i(\varphi_i))) = c_\beta(\pi(\varphi_i \times \text{Id}_{\bar{S}_i})) = c_\beta(\pi(\varphi_i) \times \text{Id}_{\bar{S}_i}) = \pi(\psi) \times \text{Id}_{\bar{S}_i} = \pi(\rho_i(\psi))$$

for some $\psi \in \text{Mor}(\mathcal{L}_i)$. So by axiom (A2) in Definition 1.7, $\alpha(\rho_i(\varphi_i)) = \rho_i(\psi)\delta(z, z')$ for some $z \in Z(P_i)$ and $z' \in Z(\bar{S}_i)$. Since $z'$ has $p$-power order, this shows that $z' = 1$ and $\alpha(\rho_i(\varphi_i)) \in \text{Mor}(\rho_i(\mathcal{L}_i))$ if $\varphi_i$ is an automorphism of order prime to $p$. Also,

$$\alpha(\rho_i(\delta_S(g_i))) = \alpha(\delta_S(g_i)) = \delta_S(\beta(g_i)) \in \text{Mor}(\rho_i(\mathcal{L}_i))$$

for all $g \in S_i$ since $\beta(g_i) \in \beta(S_i) = S_i$.

By [AV, Theorem 1.12], each morphism in $\mathcal{L}_i$ is a composite of restrictions of elements of $\text{Aut}(\mathcal{L}_i, P)$ for fully normalized subgroups $P \in \mathcal{F}_i^\ast$. Also, when $P$ is fully normalized, $\delta_P(N_S(P)) \in \text{Syl}_p(\text{Aut}(\mathcal{L}_i, P))$ (see [AKO, Proposition III.4.2(c)]), and so $\text{Aut}(\mathcal{L}_i, P)$ is generated by $\delta_P(N_S(P))$ and elements of order prime to $P$. Thus each morphism in $\mathcal{L}_i$ is a composite of restrictions of automorphisms of order prime to $p$ and elements of $\delta_i(S_i)$, and so $\alpha(\rho_i(\mathcal{L}_i)) = \rho_i(\mathcal{L}_i)$. □

As one example, if $G_1, \ldots, G_k$ are finite groups, $S_i \in \text{Syl}_p(G_i)$, and $\mathcal{L}_i = \mathcal{L}_{S_i}^p(G_i)$, then it is an easy exercise to show that the linking system $\mathcal{L}$ defined in Proposition 3.5 is the centric linking system of $G_1 \times \cdots \times G_k$. 

The subcategory \( \hat{\mathcal{L}} \subseteq \mathcal{L} \) defined in Proposition 3.5(b) is not a linking system, since \( \text{Ob}(\hat{\mathcal{L}}) \) is not closed under overgroups. However,

\[
\text{Ob}(\hat{\mathcal{L}}) = \{ P = P_1 \times \cdots \times P_k \mid P_i \leq S_i, \ P \in \mathcal{F}^c \}
\]
does include all subgroups of \( S \) that are \( \mathcal{F} \)-centric and \( \mathcal{F} \)-radical: this is shown in [AOV, Lemma 3.1] when \( k = 2 \) and follows in the general case by iteration. So Proposition 2.6 applies to the automorphism group

\[
\text{Aut}(\hat{\mathcal{L}}) = \{ \alpha \in \text{Aut}_{\text{cat}}(\hat{\mathcal{L}}) \mid \alpha(\delta_{P,S}(1)) = \delta_{\alpha(P),S}(1), \ \alpha(\delta_P(P)) = \delta_{\alpha(P)}(\alpha(P)) \ \forall \ P \in \text{Ob}(\hat{\mathcal{L}}) \}. \]

By analogy with finite groups, a saturated fusion system is indecomposable if it is not the direct product of two proper fusion subsystems.

**Lemma 3.6.** Assume Hypotheses 3.1. Let \( \mathcal{L}_1, \ldots, \mathcal{L}_k \) be centric linking systems associated to \( \mathcal{F}_1, \ldots, \mathcal{F}_k \), respectively, and let \( \mathcal{L} \) be the centric linking system associated to \( \mathcal{F} \) defined as in Proposition 3.5. Let \( \hat{\mathcal{L}} \subseteq \mathcal{L} \) be the full subcategory with objects the subgroups \( P_1 \times \cdots \times P_k \leq S \) for \( P_i \in \mathcal{F}_i^c = \text{Ob}(\mathcal{L}_i) \), and let \( \xi_{\mathcal{L}} : \prod_{i=1}^k \mathcal{L}_i \xrightarrow{\cong} \hat{\mathcal{L}} \leq \mathcal{L} \) be as in Proposition 3.5(b). Then

(a) \( \xi_{\mathcal{L}} \) induces a homomorphism

\[
c_{\xi} : \text{Aut}(\mathcal{L}_1) \times \cdots \times \text{Aut}(\mathcal{L}_k) \longrightarrow \text{Aut}(\hat{\mathcal{L}})
\]
that sends \( (\alpha_1, \ldots, \alpha_k) \) to \( \xi_{\mathcal{L}}(\alpha_1 \times \cdots \times \alpha_k) \xi_{\mathcal{L}}^{-1} \);

(b) each \( \tilde{\alpha} \in \text{Aut}(\hat{\mathcal{L}}) \) has a unique extension \( E_{\mathcal{L}}(\tilde{\alpha}) \) to an automorphism of \( \mathcal{L} \), in this way defining an injective homomorphism \( E_{\mathcal{L}} : \text{Aut}(\hat{\mathcal{L}}) \longrightarrow \text{Aut}(\mathcal{L}) \); and

(c) if \( Z(\mathcal{F}_i) = 1 \) and \( \mathcal{F}_i \) is indecomposable for each \( i \), then \( E_{\mathcal{L}} \) is an isomorphism.

**Proof.** (a) This formula clearly defines a homomorphism to the group \( \text{Aut}_{\text{cat}}(\hat{\mathcal{L}}) \) of all automorphisms of \( \hat{\mathcal{L}} \) as a category. That \( \xi_{\mathcal{L}}(\alpha_1 \times \cdots \times \alpha_k) \xi_{\mathcal{L}}^{-1} \) (for \( \alpha_i \in \text{Aut}(\mathcal{L}_i) \)) sends inclusions in \( \hat{\mathcal{L}} \) to inclusions and sends distinguished subgroups to distinguished subgroups follows from the commutativity of the square in Proposition 3.5(b).

(b) We will show that each \( \tilde{\alpha} \in \text{Aut}(\hat{\mathcal{L}}) \) extends to some \( \alpha \in \text{Aut}(\mathcal{L}) \). By the definition in Proposition 3.5, each morphism in \( \mathcal{L} \) is a restriction of a morphism in \( \hat{\mathcal{L}} \), and hence there is at most one such extension. So upon setting \( E_{\mathcal{L}}(\tilde{\alpha}) = \alpha \), we get a well defined injective homomorphism from \( \text{Aut}(\hat{\mathcal{L}}) \) to \( \text{Aut}(\mathcal{L}) \).

Fix \( \tilde{\alpha} \in \text{Aut}(\hat{\mathcal{L}}) \), and let \( \beta = \tilde{\mu}_{\mathcal{L}}(\tilde{\alpha}) \in \text{Aut}(\mathcal{F}) \) be the automorphism of Proposition 2.6 and Definition 2.7. Thus \( \pi \circ \tilde{\alpha} = c_{\beta} \circ \pi \), and \( \tilde{\alpha}(P) = \beta(P) \) for all \( P \in \text{Ob}(\hat{\mathcal{L}}) \). In terms of \( \mathcal{L} \) and \( \hat{\mathcal{L}} \), the definition of morphisms in Proposition 3.5 takes the form

\[
\text{Mor}_{\mathcal{L}}(P, Q) = \{ \psi \in \text{Mor}_{\hat{\mathcal{L}}}(\hat{P}, \hat{Q}) \mid \pi(\psi)(P) \leq Q \}
\]
for all \( P, Q \in \text{Ob}(\mathcal{L}) \), where \( \hat{P} \) and \( \hat{Q} \) are as in Hypotheses 3.1. Also, \( \beta(\hat{P}) = \hat{\beta}(P) \) for each \( P \in \text{Ob}(\mathcal{L}) \), since \( \hat{P} \) and \( \hat{\beta}(P) \) are the unique minimal objects of \( \hat{\mathcal{L}} \) containing \( P \) and \( \beta(P) \), and since \( \beta \) permutes the objects of \( \hat{\mathcal{L}} \) and of \( \mathcal{L} \). (We are not assuming here that \( \beta \) permutes the factors \( S_i \).)

For all \( P, Q \in \text{Ob}(\mathcal{L}) \) and \( \psi \in \text{Mor}_{\mathcal{L}}(P, Q) \subseteq \text{Mor}_{\hat{\mathcal{L}}}(\hat{P}, \hat{Q}) \), we have

\[
\pi(\tilde{\alpha}(\psi))(\beta(P)) = c_{\beta}(\pi(\psi))(\beta(P)) = \beta(\pi(\psi)(P)) \leq \beta(Q) : \]
the first equality since \( \pi \circ \tilde{\alpha} = c_{\beta} \circ \pi \) and the inequality since \( \pi(\psi)(P) \leq Q \) by (3.1). So \( \tilde{\alpha}(\psi) \in \text{Mor}_{\mathcal{L}}(\beta(P), \beta(Q)) \) by (3.1) again. We can thus define \( \alpha \in \text{Aut}(\mathcal{L}) \) extending \( \tilde{\alpha} \) by setting \( \alpha(P) = \beta(P) \) for all \( P \), and letting \( \alpha_{P,Q} \) be the restriction of \( \tilde{\alpha}_{\hat{P},\hat{Q}} \) for \( P, Q \in \text{Ob}(\mathcal{L}) \).
(c) Now assume that $Z(F_i) = 1$ and $F_i$ is indecomposable for each $i$. By [O6, Corollary 5.3], $F$ has a unique factorization as a product of indecomposable fusion systems.

Fix $\alpha \in \operatorname{Aut}(L)$, and set $\beta = \tilde{\mu}_L(\alpha) \in \operatorname{Aut}(F)$ (Definition 2.7). By the uniqueness of the factorization, there is $\gamma \in \Sigma_k$ such that $c_\beta(F_i) = F_{\gamma(i)}$ for each $1 \leq i \leq k$. In particular, $\beta(S_i) = S_{\gamma(i)}$ for each $i$. So for each object $P = P_1 \times \cdots \times P_k$ in $\hat{L}$, $\beta(P) = \prod_{i=1}^k \beta(P_i)$ is also an object in $\hat{L}$. Hence $\alpha(\hat{L}) = \hat{L}$ and $\alpha = E_L(\alpha|_{\hat{L}})$. Since $\alpha \in \operatorname{Aut}(L)$ was arbitrary, $E_L$ is onto.

We are now ready to prove our main results concerning the automorphism group of a product of linking systems.

**Proposition 3.7.** Assume Hypotheses 3.1. Let $L_i$ be a centric linking system associated to $F_i$ for each $1 \leq i \leq k$, and let $L$ be the centric linking system associated to $F$ defined as in Proposition 3.5. Set

$$\Gamma = \{ \sigma \in \Sigma_k \mid F_\sigma(i) \cong F_i \text{ for each } 1 \leq i \leq k \}.$$

(a) There is an injective homomorphism

$$\Phi_L : (\operatorname{Aut}(L_1) \times \cdots \times \operatorname{Aut}(L_k)) \times \Gamma \longrightarrow \operatorname{Aut}(L)$$

with the property that for each $(\alpha_1, \ldots, \alpha_k) \in \prod_{i=1}^k \operatorname{Aut}(L_i)$, $(P_1, \ldots, P_k) \in \prod_{i=1}^k \operatorname{Ob}(L_i)$, and $(\varphi_1, \ldots, \varphi_k) \in \prod_{i=1}^k \operatorname{Mor}(L_i)$, we have

$$\Phi_L(\alpha_1, \ldots, \alpha_k) \cdot (P_1 \times \cdots \times P_k) = \alpha_1(P_1) \times \cdots \times \alpha_k(P_k)$$

and

$$\Phi_L(\alpha_1, \ldots, \alpha_k)(\varphi_1, \ldots, \varphi_k) = (\alpha_1(\varphi_1), \ldots, \alpha_k(\varphi_k))$$

for $\alpha_i \in \operatorname{Aut}(L_i)$. Furthermore,

$$\Phi_L(\prod_{i=1}^k \operatorname{Aut}(L_i)) = \operatorname{Aut}^0(L) \overset{\text{def}}{=} \{ \alpha \in \operatorname{Aut}(L) \mid \alpha_s(\delta_s(S_i)) = \delta_s(S_i) \text{ for each } 1 \leq i \leq k \}.$$

(b) If $Z(F) = 1$, and $F_i$ is indecomposable for each $i$, then $\Phi_L$ is an isomorphism, and induces an isomorphism

$$\tilde{\Phi}_L : (\operatorname{Out}(L_1) \times \cdots \times \operatorname{Out}(L_k)) \times \Gamma \longrightarrow \cong \operatorname{Out}(L)$$

(c) Assume that $Z(F) = 1$, and that $F_i$ is indecomposable and tame for each $i$. Then $F$ is tame. If $G_1, \ldots, G_k$ are finite groups such that $O_{p'}(G_i) = 1$ and $F_i$ is tamely realized by $G_i$ for each $i$, and such that $F_i \cong F_j$ implies $G_i \cong G_j$, then $F$ is tamely realized by the product $G_1 \times \cdots \times G_k$.

**Proof.** Let $\hat{L} \subseteq L$ be the full subcategory defined in Proposition 3.5(b). Thus $\operatorname{Ob}(\hat{L})$ is the set of all $P \in \operatorname{Ob}(L) = F^c$ such that $P = \hat{P}$.

Without loss of generality, for each pair of indices $i, j$ such that $F_i \cong F_j$, we can assume that $F_i = F_j$ and $S_i = S_j$. Then $L_i \cong L_j$ by Theorem 1.9, and so we can also assume that $L_i = L_j$.

(a) Define $\Phi_L$ to be the composite

$$\Phi_L : (\operatorname{Aut}(L_1) \times \cdots \times \operatorname{Aut}(L_k)) \times \Gamma \longrightarrow \cong \operatorname{Aut}(\hat{L}) \longrightarrow \operatorname{Out}(\hat{L})$$

where $E_L$ is the homomorphism of Lemma 3.6(b), where the restriction of $\tilde{\xi}$ to $\prod_{i=1}^k \operatorname{Aut}(L_i)$ is the homomorphism $c_\xi$ of Lemma 3.6(a), and where

$$\tilde{\xi}(\gamma)(\varphi_1, \ldots, \varphi_k) = (\varphi_{\gamma^{-1}(1)}, \ldots, \varphi_{\gamma^{-1}(k)})$$

(3.3)
for $\gamma \in \Gamma$ and $\varphi_i \in \text{Mor}(L_i)$. Then (3.2) holds by the definition of $c_\xi$. One easily checks using (3.2) and (3.3) that $\Phi_L$ is an injective homomorphism.

It remains to check that $\Phi_L\big(\prod_{i=1}^k \text{Aut}(L_i)\big) = \text{Aut}^0(L)$: the subgroup of those $\alpha \in \text{Aut}(L)$ such that $\alpha_S(\delta_S(S_i)) = \delta_S(S_i)$ for each $i$. The inclusion of the first group in $\text{Aut}^0(L)$ is clear. By Proposition 3.5(c), there are embeddings of categories $\rho_i : L_i \rightarrow L$ sending $P_i \leq S_i$ to its product with the $S_i$ for all $i \neq i$, and $\alpha(\rho_i(L_i)) = \rho_i(L_i)$ for each $\alpha \in \text{Aut}^0(L)$. We can thus define $\Psi_{L,i} : \text{Aut}^0(L) \rightarrow \text{Aut}(L_i)$ by sending $\alpha$ to $\rho_i^{-1}\alpha\rho_i$. Set $\Psi^0_L = (\Psi_{L,1}, \ldots, \Psi_{L,k})$; then $\Phi_L \circ \Psi^0_L$ is the inclusion of $\text{Aut}^0(L)$ into $\text{Aut}(L)$, and so $\text{Aut}^0(L) \leq \text{Im}(\Phi_L)$.

(b) Fix $\alpha \in \text{Aut}(L)$, and set $\beta = \tilde{\mu}_L(\alpha) \in \text{Aut}(F)$ (see Definition 2.7). By [AOV, Proposition 3.6] and since $Z(F) = 1$ and the $F_i$ are indecomposable, $c_\beta$ permutes the factors $F_i$.

Let $\gamma \in \Sigma_k$ be such that $c_\beta(F_i) = F_{\gamma(i)}$ for each $i$, and hence also $\beta(S_i) = S_{\gamma(i)}$ and $\alpha_S(\delta_S(S_i)) = \delta_S(S_{\gamma(i)})$. In particular, $\gamma \in \Gamma$. Then $\Phi_L(\gamma)^{-1} \circ \alpha \in \text{Aut}(L)$, and since $\text{Aut}^0(L) \leq \text{Im}(\Phi_L)$ by (a), this shows that $\text{Aut}(L) \leq \text{Im}(\Phi_L)$ and hence that $\Phi_L$ is onto.

Since $\text{Aut}_L(S) = \text{Aut}_{L_1}(S_1) \times \cdots \times \text{Aut}_{L_k}(S_k)$, $\Phi_L$ induces an isomorphism of quotient groups

$$\overline{\Phi}_L : \left(\text{Out}(L_1) \times \cdots \times \text{Out}(L_k)\right) \times \Gamma \xrightarrow{\cong} \text{Out}(L).$$

(c) Assume now that $Z(F) = 1$, and that $F_i$ is indecomposable and tame for each $i$. Let $G_1, \ldots, G_k$ be such that $O'_{p'}(G_i) = 1$ and $F_i$ is tamely realized by $G_i$ for each $i$, and such that $F_i \cong F_j$ implies $G_i \cong G_j$. For each $i$, $Z(G_i)$ is a $p$-group and hence $Z(G_i) \leq Z(F_i) = 1$ by Lemma 1.6(b). Without loss of generality, we can assume that $G_i = G_j$ whenever $G_i \cong G_j$ and also (by the uniqueness of linking systems again) that $F_i = F_{S_i}(G_i)$ and $L_i = L_{S_i}(G_i)$ for each $i$. Note that each $G_i$ is indecomposable: since $O'_{p'}(G_i) = 1$, a nontrivial factorization of $G_i$ would induce a nontrivial factorization of $F_i$.

Set $\kappa_i = \kappa_{G_i} : \text{Out}(G_i) \rightarrow \text{Out}(L_i)$ for short. Fix splittings $s_i : \text{Out}(L_i) \rightarrow \text{Out}(G_i)$ for all $i$, chosen so that $s_i = s_j$ if $G_i = G_j$.

Consider the following diagram

$$
\begin{array}{c}
\text{(Out}(L_1) \times \cdots \times \text{Out}(L_k)) \times \Gamma \\
\downarrow (s_1, \ldots, s_k) \times \text{Id}_{\Gamma} \\
\text{(Out}(G_1) \times \cdots \times \text{Out}(G_k)) \times \Gamma \\
\downarrow (\kappa_1, \ldots, \kappa_k) \times \text{Id}_{\Gamma} \\
\text{(Out}(L_1) \times \cdots \times \text{Out}(L_k)) \times \Gamma
\end{array}
$$

where $\overline{\Phi}_G$ is the isomorphism of Proposition 3.4 (as defined when taking $\lambda_{ij} = \text{Id}_{G_i}$ for each $i < j$ such that $G_i = G_j$), where $s$ is defined to make the top square commute, and where the commutativity of the bottom square is immediate from the definitions. Thus $\kappa_G \circ s = \text{Id}_{\text{Out}(L)}$, so $\kappa_G$ is split surjective, and $F$ is tamely realized by $G$. \hfill \Box

4. Components of groups and of fusion systems

In this section, we set up some tools that will be used later when proving inductively that all realizable fusion systems are tame. The starting point for the inductive procedure
is Theorem 4.5, which summarizes the main results in [OR]. Note that if \( F \) is a saturated fusion system such that \( O^p(F) \) is simple, then for each finite group \( G \) with \( O^p(G) = 1 \) that realizes \( F \), \( O^p(G) \) is simple (so \( G \) is almost simple), and \( O^p(G) \) realizes \( F \) if \( F \) is simple.

Let \( \text{Comp}(G) \) denote the set of components of a finite group \( G \); i.e., the set of subnormal subgroups of \( G \) that are quasisimple. (Recall that a subgroup \( H \) of \( G \) is subnormal, denoted \( H \trianglelefteq G \), if there is a sequence \( H = H_0 \trianglelefteq H_1 \trianglelefteq \cdots \trianglelefteq H_k = G \) with each subgroup normal in the following one, and \( H \) is quasisimple if \( H \) is perfect and \( H/Z(H) \) is simple.) The components of \( G \) commute with each other pairwise (see [A1, §31] or [AKO, Lemma A.12]). In particular, when \( O_q(G) = 1 \) for all primes \( q \), they are all simple groups, and the subgroup \( E(G) \overset{\text{def}}{=} \langle \text{Comp}(G) \rangle \) is their direct product.

Similarly, the components of a saturated fusion system \( F \) over a finite \( p \)-group \( S \) are its subnormal fusion subsystems \( C \trianglelefteq \trianglelefteq F \) that are quasisimple (i.e., \( O^p(C) = C \) and \( C/Z(C) \) is simple). The set of components of \( F \) will be denoted \( \text{Comp}(F) \).

By analogy with the case for groups, a central product of fusion systems \( \mathcal{E}_1, \ldots, \mathcal{E}_k \) is a fusion system \( \mathcal{E} \cong \langle \mathcal{E}_1 \times \cdots \times \mathcal{E}_k \rangle/\langle Z \rangle \), for some central subgroup \( Z \trianglelefteq \prod_{i=1}^k Z(\mathcal{E}_i) \) that intersects trivially with each factor \( Z(\mathcal{E}_i) \). More precisely, if \( F \) is a fusion system over \( S \) and \( \mathcal{E}_1, \ldots, \mathcal{E}_k \trianglelefteq F \) are fusion subsystems over \( T_1, \ldots, T_k \trianglelefteq S \), then the subsystems commute in \( F \) if the \( T_i \) commute pairwise, and for each \( k \)-tuple of morphisms \( (\varphi_1, \ldots, \varphi_k) \), where \( \varphi_i \in \text{Hom}_{\mathcal{E}_i}(P_i, Q_i) \), there is a morphism \( \overline{\varphi} \in \text{Hom}_\mathcal{F}(P_1 \cdots P_k, Q_1 \cdots Q_k) \) that extends each of the \( \varphi_i \). Note in particular that

\[ \mathcal{E}_1, \ldots, \mathcal{E}_k \text{ commute } \implies \mathcal{E}_i \leq C_\mathcal{F}(T_j) \text{ for each } i \neq j. \]

In this situation, the (internal) central product of the \( \mathcal{E}_i \) is the fusion subsystem

\[ \mathcal{E}_1 \cdots \mathcal{E}_k = \langle \overline{\varphi} \in \text{Hom}_F(P_1 \cdots P_k, Q_1 \cdots Q_k) \mid P_i, Q_i \leq T_i, \overline{\varphi}|_{P_i} \in \text{Hom}_{\mathcal{E}_i}(P_i, Q_i) \forall 1 \leq i \leq k \rangle \leq F \]

over \( T_1 \cdots T_k \leq S \). See Definition 2.4 and Lemma 2.8 in [O6] for some more details, and see [He2, Proposition 3.3] for a slightly different approach to defining central products of fusion subsystems.

By [A2, 9.8–9.9], the components of a saturated fusion system \( F \) commute, and also commute with \( O_p(F) \). So by analogy with finite groups, when \( F \) is a saturated fusion system over a finite \( p \)-group and \( \text{Comp}(F) = \{ C_1, \ldots, C_k \} \), one defines

\[ E(F) = C_1 \cdots C_k \quad \text{and} \quad F^*(F) = E(F)O_p(F) \]

(central products). In particular, \( F^*(F) \) is the generalized Fitting subsystem of \( F \).

Note that when \( O_p(F) = 1 \), the components of \( F \) are all simple, and \( F^*(F) = E(F) \) is their direct product.

**Lemma 4.1.** Let \( F \) be a saturated fusion system over a finite \( p \)-group \( S \). Then

(a) \( E(F) \) is characteristic in \( F \);

(b) \( F^*(F) \) is characteristic and centric in \( F \); and

(c) if \( \mathcal{E} \trianglelefteq F \) and \( C \in \text{Comp}(F) \setminus \text{Comp}(\mathcal{E}) \), then \( F \) contains a central product of \( C \) and \( \mathcal{E} \).

**Proof.** These are all shown in Chapter 9 of [A2]: point (a) in 9.8.1 and 9.8.2, point (b) in 9.9 and 9.11, and (c) in 9.13. More precisely, \( F^*(F) \) is centric in \( F \) since \( C_S(F^*(F)) = Z(F^*(F)) \) by [A2, 9.11].
Lemma 4.2. Let $\mathcal{E} \leq \mathcal{F}$ be a normal pair of saturated fusion systems over finite $p$-groups. Then

(a) $\text{Comp}(\mathcal{E})$ is equal to the set of all $\mathcal{C} \in \text{Comp}(\mathcal{F})$ such that $\mathcal{C} \leq \mathcal{E}$;

(b) if $\mathcal{E}$ is centric in $\mathcal{F}$ or has $p$-power index in $\mathcal{F}$, then $\text{Comp}(\mathcal{E}) = \text{Comp}(\mathcal{F})$; and

(c) if $O_p(\mathcal{F}) = 1$ and $\text{Comp}(\mathcal{E}) = \text{Comp}(\mathcal{F})$, then $\mathcal{E}$ is centric in $\mathcal{F}$.

Proof. (a,b) In all cases, each fusion subsystem subnormal in $\mathcal{E}$ is subnormal in $\mathcal{F}$, and hence $\text{Comp}(\mathcal{E}) \subseteq \text{Comp}(\mathcal{F})$. If $\mathcal{C} \in \text{Comp}(\mathcal{F}) \setminus \text{Comp}(\mathcal{E})$, then by Lemma 4.1(c), $\mathcal{F}$ contains a central product of $\mathcal{C}$ and $\mathcal{E}$, and in particular, $\mathcal{C} \not\leq \mathcal{E}$. This proves (a), and also shows that $\mathcal{E}$ is not centric in $\mathcal{F}$ in this case, proving the first part of (b). If $\mathcal{E}$ has $p$-power index in $\mathcal{F}$, then $\mathcal{F}$ cannot be a central product of $\mathcal{E}$ with a quasisimple system, so $\text{Comp}(\mathcal{E}) = \text{Comp}(\mathcal{F})$ also in this case.

(c) If $O_p(\mathcal{F}) = 1$ and $\text{Comp}(\mathcal{E}) = \text{Comp}(\mathcal{F})$, then $\mathcal{E} \geq E(\mathcal{F}) = F^*(\mathcal{F})$ is the generalized Fitting subsystem of $\mathcal{F}$. Since $F^*(\mathcal{F})$ is centric in $\mathcal{F}$ by Lemma 4.1(b), so is $\mathcal{E}$. □

In the proof of the next lemma, we need to work with the centralizer fusion subsystem $C_\mathcal{F}(\mathcal{E})$ of a normal fusion subsystem $\mathcal{E} \leq \mathcal{F}$ over $T \leq S$. This was defined by Henke [He2] to be the unique fusion subsystem over $C_\mathcal{S}(\mathcal{E})$ of $p$-power index in $C_\mathcal{F}(T)$. (There is such a subsystem by [AKO, Theorem I.7.4] and since $C_\mathcal{S}(\mathcal{E}) \geq \text{foc}(C_\mathcal{F}(T))$ by [He2, Proposition 1].) By [He2, Proposition 6.3], it is equal to the subsystem $C_\mathcal{F}(\mathcal{E})$ defined by Aschbacher in [A2, Chapter 6].

Lemma 4.3. Let $\mathcal{F}$ be a saturated fusion system over a finite $p$-group $S$. Set $\text{Comp}(\mathcal{F}) = \{\mathcal{C}_1, \ldots, \mathcal{C}_k\}$ where $\mathcal{C}_i$ is a fusion subsystem over $U_i$ for each $1 \leq i \leq k$. Let $Z \leq Z(\mathcal{F})$ be a central subgroup. Then $\text{Comp}(\mathcal{F}/Z) = \{Z\mathcal{C}_1/Z, \ldots, Z\mathcal{C}_k/Z\}$.

Proof. Set $\text{Comp}_0(\mathcal{F}/Z) = \{Z\mathcal{C}_1/Z, \ldots, Z\mathcal{C}_k/Z\}$ for short. For each $i$, $Z\mathcal{C}_i/Z \leq \mathcal{F}/Z$ by Lemmas 1.21 and 1.18 and since $\mathcal{C}_i \leq \mathcal{F}$. Also, $Z\mathcal{C}_i/Z \simeq \mathcal{C}_i/(Z \cap U_i)$ by Lemma 1.22 and hence is quasisimple. Thus $Z\mathcal{C}_i/Z \in \text{Comp}(\mathcal{F}/Z)$ for each $i$, and $\text{Comp}(\mathcal{F}/Z) \supseteq \text{Comp}_0(\mathcal{F}/Z)$.

It remains to prove the opposite inclusion. Set $\mathcal{E} = E(\mathcal{F})$: the central product of the $\mathcal{C}_i$. It is a saturated fusion system over $U = U_1 \cdots U_k$, and is normal in $\mathcal{F}$ by Lemma 4.1(a). Set $K = \{\alpha \in \text{Aut}_\mathcal{F}(ZU) \mid [\alpha, U] \leq Z\}$: a $p$-group of automorphisms by [G, Corollary 5.3.3]. Each $\varphi \in \text{Hom}_{C_\mathcal{F}/Z}(ZU/Z, P/Z, Q/Z)$ (for $Z \leq P, Q \leq N^K_\mathcal{F}(ZU)$) extends to $\bar{\varphi} \in \text{Hom}_{\mathcal{F}/Z}(PU/Z, QU/Z)$ such that $\bar{\varphi}|_{ZU/Z} = \text{Id}$, and this in turn lifts to $\psi \in \text{Hom}_{\mathcal{F}}(PU, QU)$ with $\psi|_{ZU} \in K$. Thus $N^K_{\mathcal{F}}(ZU)/Z = C_{\mathcal{F}/Z}(ZU/Z)$.

Recall that $K$ is a $p$-group. Hence by Lemma 1.16, the centralizer $C_\mathcal{F}(ZU)$ is normal of $p$-power index in $N^K_{\mathcal{F}}(ZU)$. Also, $C_\mathcal{F}(\mathcal{E})$ has $p$-power index in $C_\mathcal{F}(U) = C_\mathcal{F}(ZU)$ by Henke’s definition in [He2], and so we have inclusions

$$C_\mathcal{F}(\mathcal{E})/Z \leq C_\mathcal{F}(ZU)/Z \leq N^K_{\mathcal{F}}(ZU)/Z = C_{\mathcal{F}/Z}(ZU/Z),$$

each of $p$-power index in the next. Each component of $\mathcal{F}/Z$ not in $\text{Comp}_0(\mathcal{F}/Z)$ commutes with the $Z\mathcal{C}_i/Z$, hence is contained in $C_{\mathcal{F}/Z}(ZU/Z)$, hence is contained in $C_{\mathcal{F}(\mathcal{E})/Z}$ by Lemma 4.2(b), and hence lies in $\text{Comp}(C_{\mathcal{F}(\mathcal{E})}/Z)$ by Lemma 4.2(a) and since $C_{\mathcal{F}(\mathcal{E})}/Z \leq \mathcal{F}/Z$ by Lemma 1.18.

By [A2, 9.12.3] and since $\mathcal{E} = E(\mathcal{F})$, the centralizer subsystem $C_{\mathcal{F}(\mathcal{E})}$ is constrained. Hence $C_{\mathcal{F}(\mathcal{E})}/Z$ is also constrained by [He3, Lemma 2.10], so $\text{Comp}(C_{\mathcal{F}(\mathcal{E})}/Z) = \emptyset$, finishing the proof that $\text{Comp}(\mathcal{F}/Z) = \text{Comp}_0(\mathcal{F}/Z)$. □
In the next lemma, we use the following notation to describe certain automorphism groups. For a fixed prime $p$ and integers $k \mid m \mid (p - 1)$ and $n, \ell \geq 1$, let $G(m, k, n) \leq \text{GL}_n(\mathbb{Z}/p^\ell)$ be the subgroup

$$G(m, k, n) = \{ \text{diag}(u_1, \ldots, u_n) \in \text{GL}_n(\mathbb{Z}/p^\ell) \mid u_i^m = 1 \forall i, \ (u_1 \cdots u_n)^{m/k} = 1 \} \cdot \mathfrak{Perm}(n),$$

where $\mathfrak{Perm}(n) \simeq \Sigma_n$ is the group of all permutation matrices. Thus $G(m, 1, n) \cong C_m \wr \Sigma_n$, the group of all monomial matrices whose nonzero entries are $m$-th roots of unity in $\mathbb{Z}/p^\ell$, and $G(m, k, n)$ has index $k$ in $G(m, 1, n)$.

The following is a version of [OR, Lemma 4.7] that has been reformulated so as to not depend on the classification of finite simple groups.

**Lemma 4.4.** Let $\mathcal{F}$ be a saturated fusion system over a finite $p$-group $S$, for some prime $p \geq 5$, and assume $A \leq S$ is abelian and $\mathcal{F}$-centric. Assume also, for some $\ell \geq 1, \kappa \geq p$, and $2 < m \mid (p - 1)$, that $A$ is homocyclic of rank $\kappa$ and exponent $p^\ell$, and that with respect to some basis $\{a_1, \ldots, a_\kappa\}$ for $A$ as a $\mathbb{Z}/p^\ell$-module, $\text{Aut}_\mathcal{F}(A)$ contains $G(m, m, \kappa)$ with index prime to $p$, and

$$\text{Aut}_\mathcal{F}(A) \cap G(m, 1, \kappa) = G(m, r, \kappa) \leq \text{GL}_1(\mathbb{Z}/p^\ell) \quad \text{for some } 2 < r \mid m.$$

Then either $A \leq \mathcal{F}$, or $O^\mathcal{F}(\mathcal{F})$ is simple and $\mathcal{F}$ is not realized by any known finite almost simple group.

**Proof.** Since $\text{Aut}_\mathcal{F}(A)$ contains $G(m, m, \kappa)$ with index prime to $p$, some subgroup conjugate to $\text{Aut}_S(A)$ is contained in $G(1, 1, \kappa) \cong \Sigma_\kappa$, and hence $\text{Aut}_S(A)$ permutes some basis of $\Omega_1(A)$. Also, $G(m, m, \kappa)$ acts faithfully on $\Omega_1(A)$, as does each subgroup of $\text{Aut}_\mathcal{F}(A)$ of order prime to $p$ (see [G, Theorem 5.2.4]). So by the assumptions on $\text{Aut}_\mathcal{F}(A)$,

$$\text{Aut}_\mathcal{F}(A) \text{ acts faithfully on } \Omega_1(A), \text{ Aut}_S(A) \text{ permutes a basis of } \Omega_1(A), \text{ and } C_S(\Omega_1(A)) = A. \quad (4.1)$$

We next claim that

$$\Omega_1(A) \text{ is the only elementary abelian subgroup of } S \text{ of rank } \kappa. \quad (4.2)$$

This is well known, but the proof is simple enough that we give it here. Set $V = \Omega_1(A)$ for short, let $W \leq S$ be another elementary abelian subgroup, and set $\overline{W} = \text{Aut}_W(V)$ and $r = \text{rk}(\overline{W})$. Then $r = \text{rk}(W/C_W(V))$ where $C_W(V) = W \cap A = W \cap V$ by (4.1). Let $\mathcal{B}$ be a basis for $V$ permuted by $\overline{W}$, and assume $\overline{W}$ acts on $\mathcal{B}$ with $s$ orbits (including fixed orbits) of lengths $p^{m_1}, \ldots, p^{m_s}$. Then $p^r = |\overline{W}| \leq p^{m_1} \cdots p^{m_s}$, and hence $m_1 + \cdots + m_s \geq r$. So

$$\text{rk}(W) = r + \text{rk}(W \cap V) \leq r + \text{rk}(C_W(\overline{V})) = r + s \leq \sum_{i=1}^s (m_i + 1) < \sum_{i=1}^s p^{m_i} = \text{rk}(V),$$

proving (4.2). In particular, $\Omega_1(A)$ and $A = C_S(\Omega_1(A))$ are weakly closed in $\mathcal{F}$.

Set $G_0(m, m, \kappa) = O^\mathcal{F}(G(m, m, \kappa)) \cong (C_m)^{\kappa-1} \rtimes A_\kappa$: the unique subgroup of index 2 in $G(m, m, \kappa)$. There are exactly $\kappa$ 1-dimensional subspaces of $\Omega_1(A)$ invariant under the action of $O^\mathcal{F}(G_0(m, m, \kappa)) \cong (C_m)^{\kappa-1}$, and they are permuted transitively by the alternating group $A_\kappa$. Hence

$$\Omega_1(A) \text{ is a simple } \mathbb{F}_p[G_0(m, m, \kappa)]\text{-module.} \quad (4.3)$$

Set $\mathcal{F}_0 = O^\mathcal{F}(\mathcal{F})$. Set $\Gamma = \text{Aut}_\mathcal{F}(A)$ and $\Gamma_0 = \text{Aut}_{\mathcal{F}_0}(A)$. Thus $\Gamma_0 \geq G_0(m, m, \kappa)$ since $\Gamma \geq G(m, m, \kappa)$.

**Step 1:** Assume $\mathcal{F}_0$ is not simple, and let $\mathcal{E} \leq \mathcal{F}_0$ be a proper nontrivial normal subsystem over $1 \neq T \leq S$. Then $T$ is strongly closed in $\mathcal{F}_0$, so $T \cap A$ is normalized by the action of $\Gamma_0$.
on $A$, and $T \cap A = \Omega_k(A)$ for some $1 \leq k \leq \ell$ since $\Omega_1(A)$ is simple by (4.3). Also, $T/\Omega_k(A)$ is normal in $S/\Omega_k(A)$, so if $k < \ell$ and $T > \Omega_k(A)$, then $T/\Omega_k(A) \cap Z(S/\Omega_k(A)) \neq 1$. Since $Z(S/\Omega_k(A)) \leq A/\Omega_k(A)$, this implies that $T \cap A > \Omega_k(A)$, contradicting the choice of $k$. Thus either $T = \Omega_k(A)$ for some $1 \leq k \leq \ell$, or $T > A$.

If $T = \Omega_k(A)$ for some $k \leq \ell$, then since $T$ is abelian and strongly closed, $T = \Omega_k(A) \trianglelefteq \mathcal{F}$ by [AKO, Corollary I.4.7(a)]. Hence for each $a \in A$ and each $x \in a^F$, there is $\varphi \in \text{Hom}_T(\Omega_k(A)(a), S)$ such that $\varphi(a) = x$ and $\varphi(\Omega_k(A)) = \Omega_k(A)$. Then $x \in C_S(\Omega_k(A)) = A$ by (4.1), so $A$ is strongly closed in this case, and $A \trianglelefteq \mathcal{F}$ by [AKO, Corollary I.4.7(a)] again.

Thus if $\mathcal{F}_0$ is not simple and $A \not\trianglelefteq \mathcal{F}$, then there is a proper normal subsystem $\mathcal{E} \trianglelefteq \mathcal{F}_0$ over $\mathcal{T} \trianglelefteq \mathcal{S}$ such that $T > A$. Set $\Delta = \text{Aut}_\mathcal{E}(A) \trianglelefteq \Gamma_0$. Then $\Delta \geq \text{Aut}_\mathcal{F}(A) \neq 1$ since $T > A$, so $p \mid |\Delta|$. Since $\Gamma_0$ contains $G_0(m, m, \kappa)$ with index prime to $p$, we have

$$\Delta \cap G_0(m, m, \kappa) \leq G_0(m, m, \kappa) \cong (C_m)^{\kappa-1} \rtimes A_\kappa$$

where $\kappa \geq p \geq 5$ and $p \mid |\Delta \cap G_0(m, m, \kappa)|$. Since $A_\kappa$ and hence $G_0(m, m, \kappa)$ have no proper normal subgroups of order a multiple of $p$, it follows that $\Delta \geq G_0(m, m, \kappa)$, and hence that $\Delta$ has index prime to $p$ in $\text{Aut}_\mathcal{F}(A)$. But then $\text{Aut}_\mathcal{F}(A) = \text{Aut}_\mathcal{S}(A)$, so $T = A$ since $A$ is $\mathcal{F}$-centric, and $\mathcal{E}$ has index prime to $p$ in $\mathcal{F}_0$ and $\mathcal{F}$ by [AOV, Lemma 1.26]. Thus $\mathcal{E} = \mathcal{F}_0 = O^{\nu}(\mathcal{F})$, contradicting our assumption that $\mathcal{E}$ is proper.

**Step 2:** It remains to show, when $A \not\trianglelefteq \mathcal{F}$, that $\mathcal{F}$ is not realized by any known finite almost simple group. Assume otherwise: assume $\mathcal{F} = \mathcal{F}_S(G)$ where $G$ is almost simple, and set $G_0 = O^{\nu}(G)$. Since $O^{\nu}(\mathcal{F})$ is simple, $G_0$ is a known simple group.

We claim this is impossible. Note that $A$ is a radical $p$-subgroup of $G_0$, since $O_p(\text{Aut}_{G_0}(A)) = 1$ and $p \nmid |C_{G_0}(A)/A|$ (i.e., $A$ is $\mathcal{F}_0$-centric). Although we do not know $\text{Aut}_{G_0}(A)$ precisely, we know that it is contained in $\text{Aut}_\mathcal{F}(A)$ and contains $G_0(m, m, \kappa) \cong (C_m)^{\kappa-1} \rtimes A_\kappa$.

Since $p \geq 5$ and $\text{rk}_p(G_0) \geq p$, $G_0$ cannot be a sporadic group by [GLS3, Table 5.6.1].

By [AF, §2], for each abelian radical $p$-subgroup $B \leq \Sigma_\kappa$, $\text{Aut}_{\Sigma_\kappa}(B)$ is a product of wreath products of the form $GL(p) \wr \Sigma_\kappa$ for $c \geq 1$ and $\kappa \geq 1$. Thus $\text{Aut}_{\Sigma_\kappa}(B)$ can have index $2$ in $C_{p-1} \wr \Sigma_\kappa$ for some $\kappa$, but not if $\kappa$ is large. So $G_0$ cannot be an alternating group.

If $G_0 \in \text{Lie}(p)$, then $N_{G_0}(A)$ is a parabolic subgroup by the Borel-Tits theorem [GLS3, Corollary 3.1.5] and since $A$ is centric and radical. So in the notation of [GLS3, §2.6], $A = U_J$ and $N_{G_0}(A) = P_J$ (up to conjugacy) for some set $J$ of primitive roots for $G_0$. Hence by [GLS3, Theorem 2.6.5(f,g)], $O^{\nu}(N_{G_0}(A)/A) \cong O^{\nu}(L_J)$ is a central product of groups in $\text{Lie}(p)$, contradicting the assumption that $O^{\nu}(\text{Aut}_G(A)) \cong G_0(m, m, \kappa)$.

Now assume that $G_0 \in \text{Lie}(g_0)$ for some prime $g_0 \neq p$. By [GL, 10-2] (and since $p \geq 5$), $S \in \text{Syl}_p(G_0)$ contains a unique elementary abelian $p$-subgroup of maximal rank, and by (4.2), it must be equal to $\Omega_1(A)$. Hence $\text{Aut}_\mathcal{F}(A)$ must be as in one of the entries in Table 4.2 or 4.3 in [OR].

- If $G_0$ is a classical group and hence $\text{Aut}_\mathcal{F}(A) \cong G(\tilde{m}, \tilde{r})$ for $\tilde{m} = \mu$ or $2\mu$ and $\tilde{r} \leq 2$ (see the next-to-last column in [OR, Table 4.2] and recall that $G(\tilde{m}, 1, \kappa) \cong C_{\tilde{m}} \wr \Sigma_\kappa$), then the identifications $\text{Aut}_\mathcal{F}(A) \cong G(\tilde{m}, \tilde{r}, \kappa)$ and $\text{Aut}_\mathcal{F}(A) \cong G(m, r, \kappa)$ are based on the same decompositions of $A$ as a direct sum of cyclic subgroups, and hence we have $m \mid \tilde{m}$ and $r \leq 2$, contradicting our original assumption.

- If $G_0$ is an exceptional group, then by [OR, Table 4.3], either $\kappa = \text{rk}(A) < p$, or $p = 3$, or (in case (b)) $m^{\kappa-1} \cdot \kappa!$ does not divide $|\text{Aut}_\mathcal{F}(A)|$ for any $m > 2$ and hence $\text{Aut}_\mathcal{F}(A)$ cannot contain any such $G(m, r, \kappa)$. \hfill $\square$

As noted at the beginning of the section, if $\mathcal{F}$ is a realizable fusion system such that $O^{\nu}(\mathcal{F})$ is simple, then $\mathcal{F}$ is realized by a finite almost simple group, and by a simple group if
\( \mathcal{F} \) is simple. We now consider the converse, by determining which fusion systems of known finite simple groups are simple or almost simple.

**Theorem 4.5.** Fix a prime \( p \) and a known finite quasisimple group \( L \) such that \( Z(L) \) is a \( p \)-group and \( p \mid |L| \). Fix \( T \in \text{Syl}_p(L) \), and set \( \mathcal{E} = \mathcal{F}_T(L) \) and \( \mathcal{C} = O^p(\mathcal{E}) \). Then \( T > Z(L) \), and either

\( a) \quad T \trianglelefteq \mathcal{E} \) and hence \( \mathcal{C} \) is not quasisimple; or

\( b) \quad p = 3 \) and \( L \cong G_2(q) \) for some \( q \equiv \pm 1 \pmod{3} \), in which case \( |O_3(\mathcal{E})| = 3 \), \( Z(\mathcal{E}) = 1 \), and \( \mathcal{C} < \mathcal{E} \) is quasisimple and is realized by \( SL_3^\pm(q) \); or

\( c) \quad p \geq 5 \), \( L \) is one of the simple classical groups \( PSL_n^\pm(q) \), \( PSp_{2n}(q) \), \( \Omega_{2n+1}(q) \), or \( PO_{2n+2}^\pm(q) \) where \( n \geq 2 \) and \( q \neq 0, \pm 1 \pmod{p} \), in which case \( \mathcal{C} \) is simple and is not realized by any known finite simple group; or

\( d) \quad \mathcal{C} \) is quasisimple, \( Z(\mathcal{C}) = Z(L) \), and \( \mathcal{C} \) is realized by a known finite quasisimple group with center \( Z(\mathcal{C}) \).

In cases \( b) \), \( c) \), and \( d) \), there is a normal fusion subsystem \( \mathcal{C}^* \trianglelefteq \mathcal{E} \) over \( T \) containing \( \mathcal{C} \) that is realized by a known finite quasisimple group, and is such that for each saturated fusion system \( \mathcal{E}' \) over \( T \) such that \( O^p(\mathcal{E}') = \mathcal{C}, \mathcal{E}' \) is realized by a known finite quasisimple group only if it contains \( \mathcal{C}^* \). Thus \( \mathcal{C}^* = \mathcal{C} \) in cases \( b) \) and \( d) \), while \( \mathcal{C}^* > \mathcal{C} \) in case \( c) \).

**Proof.** In all cases, \( T \neq 1 \) since \( p \mid |L| \) by assumption, and \( T > Z(L) \) since otherwise \( p \nmid |L/Z(L)| \) while \( p \mid |Z(L)| \), contradicting the assumption that \( L \) is perfect.

When \( L \) is simple, this is essentially [OR, Theorem 4.8], but restated to make its proof independent of the classification of finite simple groups. The only difference between the proof of this version and that of Theorem 4.8 in [OR] is that we replace [OR, Lemma 4.7] by the above Lemma 4.4. Note in case \( a) \) that \( \mathcal{C} = \mathcal{F}_T(T) \) is not quasisimple since \( O^p(\mathcal{C}) = 1 \), and in case \( d) \) that \( \mathcal{C} \) is simple and is realized by a known finite simple group (thus with center \( Z(L) = L(\mathcal{C}) = 1 \)). In case \( b) \), \( Z(\mathcal{E}) = 1 \) since \( \text{Aut}_L(T) \) acts nontrivially on \( O_3(\mathcal{E}) = O_3(\mathcal{F}_T(T)) \cong C_3 \).

Now assume that \( Z(L) \neq 1 \). Then \( Z(L) \trianglelefteq T \) since \( Z(L) \) is a \( p \)-group by assumption, and \( \mathcal{F}_{T/Z(L)}(L/Z(L)) \cong \mathcal{E}/Z(\mathcal{L}) \). Also, \( L/Z(L) \) is not isomorphic to \( G_2(q) \) for any prime power \( q \) and is not one of the groups in case \( c) \) (see [GL, 6-1], or Theorem 6.1.4 and Table 6.1.2 in [GLS3], for the description of Schur multipliers of groups of Lie type in cross characteristic). So either \( T/Z(L) \leq \mathcal{E}/Z(L) \) (case \( a) \)), in which case \( T \leq \mathcal{E}; \) or else \( O^p(\mathcal{E}/Z(L)) = \mathcal{C}/Z(L) \) is simple and is realized by a known simple group (case \( d) \)).

If \( \mathcal{C}/Z(L) \) is realized by a known simple group \( H \), then \( \mathcal{C} \) is realized by a central extension \( \hat{H} \) of \( Z(L) \) by \( H \). This follows from the proof of [BCGLO, Corollary 6.14] (the statement itself only says that \( \mathcal{C} \) is realizable). We have \( \text{foc}(\mathcal{C}/Z(L)) = T/Z(L) \) since \( H \) is simple, and hence \( T = Z(L)\text{foc}(\mathcal{C}) \). Also,

\[ T = \text{foc}(\mathcal{E}) = \text{foc}(\mathcal{C})[\text{Aut}_\mathcal{E}(T), T] = \text{foc}(\mathcal{C}), \]

where the first equality holds since \( \mathcal{E} = \mathcal{F}_T(L) \) where \( L \) is perfect, the second holds since \( \mathcal{E} \) is generated by \( \mathcal{C} = O^p(\mathcal{E}) \) and \( \text{Aut}_\mathcal{E}(T) \) by the Frattini condition for \( O^p(\mathcal{E}) \trianglelefteq \mathcal{E} \) (see [AKO, Theorem I.7.7]), and the last equality holds since \( T = Z(L)\text{foc}(\mathcal{C}) \) where \( \text{Aut}_\mathcal{E}(T) \) acts trivially on \( Z(L) \) and sends \( \text{foc}(\mathcal{C}) \) to itself. Thus \( \mathcal{C} \) and \( \hat{H} \) are quasisimple by the focal subgroup theorems (Lemma 1.15(a,b)), and \( \hat{H} \) is a known quasisimple group. So the last statement in the theorem holds in this case with \( \mathcal{C}^* = \mathcal{C} \). \( \square \)
The following terminology will be useful when stating many of the results throughout the rest of the paper.

**Definition 4.6.** Let $G$ be a finite group. We say that

(a) $G$ is $p'$-reduced if $O_{p'}(G) = 1$; and

(b) $G$ is a $\mathcal{K}'\mathcal{E}$-group if all of its components are known quasisimple groups.

Most of our statements from now on about groups will be formulated in terms of “finite $p'$-reduced $\mathcal{K}'\mathcal{E}$-groups”, a restriction that allows us to avoid assuming the classification of finite simple groups in our proofs. Note that when working with the $p$-local structure of a finite group $G$, there’s not much point in assuming that all components of $G$ are known without also assuming that $O_{p'}(G) = 1$.

**Lemma 4.7.** Let $G$ be a finite $p'$-reduced $\mathcal{K}'\mathcal{E}$-group. Then for $U \in \text{Syl}_p(F^*(G))$, the centralizer $C_G(U)$ is $p$-solvable.

**Proof.** Let $L_1, \ldots, L_k$ be the components of $G$, and fix $T_i \in \text{Syl}_p(L_i)$. Set $L = L_1 \cdots L_k$ and $T = T_1 \cdots T_k$, and set $Q = O_p(G)$. Then $F^*(G) = QL$ and $QT \in \text{Syl}_p(QL)$, so we can assume $U = QT$.

Conjugation by each element of $G$ permutes the subgroups $L_i$. Since $O_{p'}(G) = 1$, and since the Schur multiplier of a group of order prime to $p$ has order prime to $p$, we have $T_i > Z(L_i)$ for each $i$. So each element of $C_G(U)$ normalizes each of the $L_i$.

Consider the homomorphism $\gamma: C_G(U) \rightarrow \text{Out}(L)$ that sends $g \in C_G(U)$ to the class of $c_g|_L$. We just showed that $\text{Im}(\gamma) \leq \prod_{i=1}^k \text{Out}(L_i)$, when identified with a subgroup of $\text{Out}(L)$ in the obvious way. Moreover, $\text{Out}(L_i) \leq \text{Out}(L_i/Z(L_i))$ is solvable for each $i$ by the Schreier conjecture and since $L_i/Z(L_i)$ is a known simple group (see [GLS3, Theorem 7.1.1]), so $\text{Im}(\gamma)$ is also solvable.

If $g \in \text{Ker}(\gamma)$, then $c_g|_L = c_h|_L$ for some $h \in L$, so $gh^{-1} \in C_G(L)$. Then $gh^{-1} \in C_G(QL)$ since $h \in L \leq C_G(Q)$, and $h \in C_L(T)$ since $g$ and $gh^{-1}$ both commute with $T$. Thus $\text{Ker}(\gamma) \leq C_G(QL)C_L(T)$ (and the opposite inclusion is obvious). Also, $C_G(QL) \leq G$ since $QL \leq G$, and so $C_G(QL) \leq \text{Ker}(\gamma)$. By [A1, 31.13] or [AKO, Theorem A.13(c)], $C_G(QL) \leq QL$, and hence $C_G(QL) = Z(QL) = Z(Q)$: an abelian $p$-group. Also, $C_L(T)/Z(T)$ has order prime to $p$ since $T \in \text{Syl}_p(L)$. So $\text{Ker}(\gamma)$, and hence $C_G(U)$, are $p$-solvable. \qed

The following notation will be used in several of the results in the rest of the section.

**Notation 4.8.** Let $G$ be a finite $p'$-reduced $\mathcal{K}'\mathcal{E}$-group, fix $S \in \text{Syl}_p(G)$, and set $F = F_S(G)$. Set $\text{Comp}(G) = \{L_1, \ldots, L_k\}$; thus each $L_i$ is a known quasisimple group. For each $1 \leq i \leq k$, set

$$T_i = S \cap L_i, \quad E_i = F_{T_i}(L_i) \leq F, \quad \text{and} \quad C_i = O_p'(E_i).$$

Assume the $L_i$ were ordered so that for some $0 \leq m \leq k$, $C_i$ is quasisimple if and only if $i \leq m$.

**Proposition 4.9.** Let $G$ be a finite $p'$-reduced $\mathcal{K}'\mathcal{E}$-group, and assume Notation 4.8. Then

$$\text{Comp}(F) = \{C_1, \ldots, C_m\} \quad \text{and} \quad O_p(F) \geq O_p(G)T_{m+1} \cdots T_k.$$

**Proof.** Set $L = L_1 \cdots L_k$ and $T = T_1 \cdots T_k$. For each $1 \leq i \leq k$, we have $T_i \in \text{Syl}_p(L_i)$ since $L_i \leq L \leq G$, and also

$$C_i = O_p'(F_{T_i}(L_i)) \leq F_{T_i}(L_i) \leq F_T(L) \leq F_S(G) = F.$$
the first normality relation by [AKO, Theorem I.7.7] and the other two by [AKO, Proposition I.6.2] and since \( L_i \leq L \leq G \). Thus \( C_i \leq \leq F \) for each \( i \). If \( i \leq m \), then \( C_i \) is quasisimple and hence is a component of \( F \). If \( i \geq m + 1 \), then \( T_i \leq \mathcal{E}_i \) by Theorem 4.5, and hence \( T_i \leq O_p(F_T(L_i)) \leq O_p(F) \) by Lemma 2.3(b).

Set \( Q = O_p(G) \) for short. Thus \( QT_{m+1} \cdots T_k \leq O_p(F) \), and \( T_1 \cdots T_m \) is the Sylow of the central product \( C_1 \cdots C_m \).

Assume \( D \leq \leq F \) is another component. By [A2, 9.8–9.9], the components of \( F \) commute with each other and with \( O_p(F) \). Hence \( D \leq C_F(QT) \), where \( C_F(QT) \) is the fusion system of \( C_G(QT) \) by Lemma 1.6. (Note that \( QT \) is fully centralized in \( F \) since it is normal in \( S \).)

By Lemma 4.7, the centralizer \( C_G(QT) \) is \( p \)-solvable. Hence \( C_F(QT) = F_{C_S(QT)}(C_G(QT)) \) is solvable in the sense of [AKO, Definition II.12.1], and its saturated fusion subsystems are all solvable by [AKO, Lemma II.12.8]. So \( D \) is solvable, and hence is constrained by [AKO, Lemma II.12.5(b)] (see also [AKO, Definition I.4.8]), which is impossible since \( D \) was assumed to be quasisimple. We conclude that \( C_1, \ldots, C_m \) are the only components of \( F \). \( \square \)

In the next section, we will be working mostly with fusion systems that are (tamely) realized by finite \( p' \)-reduced \( \mathcal{K} \mathcal{E} \)-groups. It will be important to know that in such situations, the fusion system and the group always have the same center. The following technical lemma is needed to prove that.

**Lemma 4.10.** Fix an odd prime \( p \). Let \( G \) be a central product of known \( p' \)-reduced quasisimple groups, choose \( S \in \text{Syl}_p(G) \), and set \( F = \mathcal{F}_S(G) \). Then \( Z(F) = Z(G) \), and \( \text{Ker}(\kappa_G) \) (see Definition 2.8) has order prime to \( p \).

**Proof.** Assume the lemma holds for \( G/Z(G) \). Then \( Z(F/Z(G)) = Z(G/Z(G)) = 1 \), so \( Z(F) \leq Z(G) \), while the opposite inclusion holds since \( G \) is \( p' \)-reduced. Also, \( \text{Ker}(\kappa_G) \) has order prime to \( p \) by [AOV, Lemma 2.17].

It thus suffices to prove the lemma when \( G \) is a product of known simple groups.

\( p \nmid |\text{Ker}(\kappa_G)|; \) We first claim that if \( G \) is a finite group such that \( Z(G) = 1 \), and \( U \in \text{Syl}_p(\text{Aut}(G)) \) and \( S = U \cap \text{Inn}(G) \in \text{Syl}_p(\text{Inn}(G)) \), then

\[
C_U(S) \leq S \quad \Rightarrow \quad p \nmid |\text{Ker}(\kappa_G)|. \tag{4.4}
\]

To simplify notation, we identify \( G \) with \( \text{Inn}(G) \) (recall \( Z(G) = 1 \)), and thus identify \( S \) with a Sylow \( p \)-subgroup of \( G \). Assume (4.4) does not hold: thus \( C_U(S) \leq S \) and \( p \mid |\text{Ker}(\kappa_G)| \). Let \( \alpha \in \text{Aut}(G) \) be such that \( [\alpha] \) has order \( p \) in \( \text{Out}(G) \) and \( \kappa_G([\alpha]) = 1 \). Since \( \text{Aut}(G) = \text{Inn}(G)N_{\text{Aut}(G)}(S) \) by the Frattini argument, we can assume that \( \alpha(S) = S \) without changing the class \( [\alpha] \). Then \( \kappa_G([\alpha]) = 1 \) implies in particular that \( \alpha|_S \in \text{Aut}_G(S) \), and thus \( \alpha|_S = c_x|_S \) for some \( x \in N_G(S) \). So upon replacing \( \alpha \) by \( c_x^{-1}\alpha \), we can assume that \( \alpha \) centralizes \( S \), and upon replacing \( \alpha \) by \( \alpha^k \) for some appropriate \( k \), we can also arrange that \( \alpha \) have \( p \)-power order in \( \text{Aut}(G) \). Also, \( \alpha \in N_{\text{Aut}(G)}(S) \) and \( U \in \text{Syl}_p(N_{\text{Aut}(G)}(S)) \) imply that \( \beta\alpha\beta^{-1} \in C_U(S) \setminus S \) for some \( \beta \in N_{\text{Aut}(G)}(S) \). This contradicts our original assumption, and finishes the proof of (4.4).

By [Gr, Theorem B], \( C_U(S) \leq S \) whenever \( G \) is a known simple group. The corresponding relation for products of known simple groups then follows from the description in Proposition 3.4 of the automorphism group of a product. So \( p \nmid |\text{Ker}(\kappa_G)| \) for all such \( G \) by (4.4).

**Z(F) = Z(G):** If \( F \not\leq F \), then by Theorem 4.5, either \( G \) is as in case (b) and \( Z(F) = Z(G) = 1 \); or it is as in case (c) or (d) and \( Z(O^{p'}(F)) = Z(G) = 1 \). Since \( Z(F) \leq Z(O^{p'}(F)) \) for every saturated fusion system over a finite \( p \)-group, this proves that \( Z(F) = Z(G) = 1 \).
Now assume that $S \leq \mathcal{F}$; i.e., that $G$ is $p$-Goldschmidt in the terminology of Aschbacher. Then $Z(\mathcal{F}) = C_{Z(S)}(N_G(S)/S)$, and we must show this is trivial in all cases (recall $G$ is simple). If $S$ is abelian, then since $\text{Aut}_G(S) \cong N_G(S)/S$ has order prime to $p$, we have $S = C_S(\text{Aut}_G(S)) \times [\text{Aut}_G(S), S]$ [see [G, Theorem 5.2.3]], where the second factor is the focal subgroup $\foc(\mathcal{F})$. Also, $\foc(\mathcal{F}) = S$ since $G$ is simple, and thus $Z(\mathcal{F}) = C_S(\text{Aut}_G(S)) = 1$.

If $S \leq \mathcal{F}$ and $S$ is nonabelian, then by [A2, Theorem 15.6], $(G,p)$ is one of pairs listed in Table 4.1. In all cases, $C_S(N_G(S)) \leq [S,S]$ by an argument similar to that used when $S$ is abelian. If $G \cong \text{PSU}_3(q)$ or $^2G_2(q)$, then the explicit description of $S$ and $N_G(S)/S$ in [H, II.10.12(b)] or [HB, §XI.3], respectively, shows that $C_S(\text{Aut}_G(S)) = 1$. When $p = 3$ and $G \cong G_2(q)$ for $q \equiv \pm 2, \pm 4 \pmod{9}$, the action of the Weyl group $W \cong D_{12}$ on $Z(S) \cong C_3$ is nontrivial. In all other cases where $S \cong p_{1+}^2$, the generators of $Z(S)$ are conjugate (by [GL, §5] or [GLS3, Tables 5.3]), and so $N(S)/S$ acts nontrivially on $Z(S) = [S,S]$.

This leaves the case $G \cong J_3$ and $p = 3$. By [J, Lemma 5.4] (where $S$ is denoted $W_1$), $Z(S) \cong E_9$, and there is a subgroup $W \leq N_G(S)$ such that $Z(S) \leq W \cong E_{27}$ and $S \leq N_G(W)$. Also, $N_G(W)/S \cong C_8$; and all elements in $Z(S)^\#$ and all those in $W \triangleleft Z(S)$ are conjugate in $N_G(W)$. Thus $W \geq [S,S]$, and $C_S(N_G(S)) = 1$ in this case. \hfill $\square$

By [GLn2, Theorem 5.1] and Glauberman’s $Z^*$-theorem, Lemma 4.10 also holds when $p = 2$. More generally, in the same theorem, Glauberman and Lynd showed that for each prime $p$ for which the $Z^*$-theorem holds for all almost simple groups, one also has that $\text{Ker}(\kappa_G)$ has order prime to $p$ for all simple groups.

We are now ready to prove the $Z^*$-theorem at odd primes for all finite $p'$-reduced $\mathcal{K}^\mathcal{E}$-groups.

**Proposition 4.11.** Fix a prime $p$, let $G$ be a $p'$-reduced $\mathcal{K}^\mathcal{E}$-group, and choose $S \in \text{Syl}_p(G)$. Then $Z(\mathcal{F}_S(G)) = Z(G)$.

**Proof.** When $p = 2$, this is just Glauberman’s $Z^*$-theorem [Gl, Corollary 1], and holds for all finite $2'$-reduced groups. So it remains to prove the proposition when $p$ is odd.

Set $H = E(G)$: the central product of the components of $G$. Set $T = S \cap H$, and set $\mathcal{F} = \mathcal{F}_S(G)$ and $\mathcal{E} = \mathcal{F}_T(H)$. By Lemma 4.10, $\text{Ker}(\kappa_H)$ has order prime to $p$ and $Z(\mathcal{E}) = Z(H)$. Also, $C_G(O_p(G)H) = Z(O_p(G)H) = Z(O_p(G))$ (see [A1, 31.13]), so $O_p(G) \leq C_G(H)$ is a centric subgroup. In particular, $Z(C_G(H)) \leq Z(O_p(G))$.

Table 4.1.
Assume \( x \in Z(\mathcal{F}) \). By Lemma 2.12, there are \( y \in C_S(H) \) and \( z \in Z(\mathcal{E}) = Z(H) \) such that \( x = yz \). If \( g \in C_G(H) \) is such that \( y g \in C_S(H) \), then \( y x = (y g) z \in S \), so \( y x = x \) since \( x \in Z(\mathcal{F}) \) and hence \( y g = y \). Thus

\[
y \in Z(C_G(H)) \leq Z(O_p(G)),
\]

and since \( z \in Z(H) \leq Z(O_p(G)) \), we have \( x \in Z(O_p(G)) \). Since \( x \in Z(\mathcal{F}) \), it must be invariant under the action of \( \text{Aut}_T(Z(O_p(G))) \), and so \( x \in C_{Z(O_p(G))}(G) = Z(G) \).

This proves that \( Z(\mathcal{F}) \leq Z(G) \), and the opposite inclusion holds since \( G \) is \( p' \)-reduced. \( \square \)

A very similar proof of the \( Z^* \)-theorem at odd primes was given by Guralnick and Robinson [GR, Theorem 4.1]. If we give our own proof here, it is mostly to make our assumptions completely clear: we assume only that all components of \( G \) are known quasisimple groups. Other proofs of the \( Z^* \)-theorem, where the analogous assumptions are less restrictive or less clear, are given in [Xi, Theorem 1] and in [GLS3, Remark 7.8.3].

The next proposition is somewhat more technical.

**Proposition 4.12.** Let \( G \) be a finite \( p' \)-reduced \( \mathcal{K}' \mathcal{G} \)-group, assume Notation 4.8, and set

\[
L = L_1 \cdots L_m, \quad T = T_1 \cdots T_m, \quad \mathcal{E} = \mathcal{F}_T(L), \quad \text{and} \quad \mathcal{C} = O^{p'}(\mathcal{E}).
\]

Then \( \mathcal{C} \leq \mathcal{E} \) are the central products of the subsystems \( \mathcal{C}_i \leq \mathcal{E}_i \) for \( 1 \leq i \leq m \).

(a) There is a unique minimal normal fusion subsystem \( \mathcal{C}^* \leq \mathcal{F} \) among those subsystems containing \( \mathcal{C} = E(\mathcal{F}) \) that are realized by finite \( p' \)-reduced \( \mathcal{K}' \mathcal{G} \)-groups, and \( \mathcal{C}^* \) itself is realized by a central product of known finite quasisimple groups. More precisely, \( \mathcal{C}^* = \mathcal{C}^*_1 \cdots \mathcal{C}^*_m \), where for each \( 1 \leq i \leq m \), \( \mathcal{C}^*_i \leq \mathcal{E}_i \) is a fusion system over \( T_i \) such that \( O^{p'}(\mathcal{C}^*_i) = \mathcal{C}_i \), and \( \mathcal{C}^*_i \) is the fusion system of a known finite quasisimple group.

(b) We have \( \mathcal{C} = O^{p'}(\mathcal{C}^*) \) and \( \text{Aut}(\mathcal{C}^*) = \text{Aut}(\mathcal{C}) \), and \( \mathcal{C} \) and \( \mathcal{C}^* \) are both characteristic in \( \mathcal{F} \).

**Proof.** Let \( \varphi : L_1 \times \cdots \times L_m \longrightarrow G \) be the homomorphism induced by the inclusions \( L_i \leq G \), and let

\[
\tilde{\varphi} : \mathcal{E}_1 \times \cdots \times \mathcal{E}_m = \mathcal{F}_{T_1 \times \cdots \times T_m}(L_1 \times \cdots \times L_m) \longrightarrow \mathcal{F}_S(G) = \mathcal{F}
\]

be the induced functor between the fusion systems. Then \( \text{Im}(\tilde{\varphi}) = \mathcal{E}_1 \cdots \mathcal{E}_m \), the central product of the \( \mathcal{E}_i \), and is equal to \( \mathcal{F}_{T_1 \cdots T_m}(L_1 \cdots L_m) \). Set \( Z = \text{Ker}(\varphi) \leq \prod_{i=1}^m Z(L_i) \). Then \( \mathcal{E}_1 \cdots \mathcal{E}_m \cong (\prod_{i=1}^m \mathcal{E}_i)/Z \), and hence

\[
O^{p'}(\mathcal{E}_1 \cdots \mathcal{E}_m) \cong O^{p'}(\prod_{i=1}^m \mathcal{E}_i)/Z \cong (\prod_{i=1}^m O^{p'}(\mathcal{E}_i))/Z \cong O^{p'}(\mathcal{E}_1) \cdots O^{p'}(\mathcal{E}_m) : \]

the first isomorphism by Lemma 1.19 and the second by [AOV, Proposition 3.4]. Since these are finite categories and \( O^{p'}(\mathcal{E}_1 \cdots \mathcal{E}_m) \leq O^{p'}(\mathcal{E}_1) \cdots O^{p'}(\mathcal{E}_m) \), the two are equal.

(a) For each \( 1 \leq i \leq m \), let \( \mathcal{C}^*_i \leq \mathcal{E}_i \) be the minimal realizable fusion subsystem containing \( \mathcal{C}_i \) of Theorem 4.5. More precisely, \( \mathcal{C}^*_i \) is realized by a known finite quasisimple group, and each saturated fusion subsystem of \( \mathcal{E}_i \) that is realized by a known finite quasisimple group and contains \( \mathcal{C}_i \) also contains \( \mathcal{C}^*_i \). Since \( \mathcal{C}^*_i \leq \mathcal{E}_i \) for each \( i \) and the \( \mathcal{E}_i \) commute, the \( \mathcal{C}^*_i \) also commute.

Set \( \mathcal{C}^* = \mathcal{C}^*_1 \cdots \mathcal{C}^*_m \leq \mathcal{F} \), the central product of these subsystems. Thus \( \mathcal{C} \leq \mathcal{C}^* \leq \mathcal{E} \) where all three fusion systems are over \( T = T_1 \cdots T_m \), and where \( \mathcal{C} = E(\mathcal{F}) \leq \mathcal{F} \), and \( \mathcal{E} \leq \mathcal{F} \) since \( L_1 \cdots L_m \leq G \).

It remains to show that each normal fusion subsystem of \( \mathcal{F} \) containing \( \mathcal{C} \) and realized by a finite \( p' \)-reduced \( \mathcal{K}' \mathcal{G} \)-group also contains \( \mathcal{C}^* \). Assume that \( H \) is such a group. In particular, there is \( R \in \text{Syl}_p(H) \) such that \( T \leq R \leq S \) and \( \mathcal{C} \leq \mathcal{F}_R(H) \leq \mathcal{F} \). Let \( H_1, \ldots, H_t \leq \leq H \) be
the components of $H$ (by assumption, known quasisimple groups), and set $R_i = R \cap H_i$. By Proposition 4.9, the components of $F_R(H)$ are those subsystems $O^{\sigma}(F_R(H_i))$ for $1 \leq i \leq \ell$ that are quasisimple. Each component of $F_R(H)$ is subnormal in $F$ and hence a component of $F$ (recall $F_R(H) \subseteq F$), and each component of $F$ is contained in and hence a component of $F_R(H)$ by assumption. Thus $m \leq \ell$, and we can assume that the indices are chosen so that $T_i = R_i$ and $O^{\sigma}(F_{T_i}(H_i)) = C_i$ for each $i \leq m$.

For each $i$, $F_{T_i}(H_i)$ and $C_i^*$ are both realizable fusion systems over $T_i$ where $O^{\sigma}(F_{T_i}(H_i)) = O^{\sigma}(C_i^*) = C_i$, and so $F_{T_i}(H_i) \supseteq C_i^*$ by Theorem 4.5 (the last statement) and the minimality assumption. So $F_R(H)$ contains $C_i^*$, and thus $C_i^*$ is minimal among normal subsystems of $F$ containing $C$ and realized by finite $p'$-reduced $\mathcal{K}\mathcal{E}$-groups.

(b) Since $C \leq C_i^* \leq \mathcal{E}$ and $C = O^{\sigma}(\mathcal{E})$, we also have $C = O^{\sigma}(C_i^*)$. It remains to prove that $\text{Aut}(C_i^*) = \text{Aut}(C)$, and that $C$ and $C_i^*$ are characteristic in $F$.

Assume the central factors $C_i$ are ordered so that for some $\ell \leq m$, we have $C_i < C_i^*$ if and only if $1 \leq i \leq \ell$. For each $1 \leq i \leq \ell$, $L_i$ falls under case (c) in Theorem 4.5, so $C_i$ is simple, and $Z(C_i^*) = 1$. So if we set $T_0 = T_{\ell+1} \cdots T_m$ and $C_0 = C_{\ell+1} \cdots C_m$, the central products of the remaining factors, we get direct product decompositions

$$T = T_0 \times \cdots \times T_{\ell}, \quad C = C_0 \times \cdots \times C_{\ell} \quad \text{and} \quad C^* = C_0^* \times \cdots \times C_{\ell}^*.$$

Since $C = O^{\sigma}(C_i^*)$, we have $\text{Aut}(C_i^*) \leq \text{Aut}(C)$, and it remains to prove the opposite inclusion. Fix $\alpha \in \text{Aut}(C) \subseteq \text{Aut}(T)$. Then $\alpha(T_0) = T_0$ and $\alpha(C_0) = C_0$, and $\alpha$ permutes the factors $T_i$ and $C_i$ for $1 \leq i \leq \ell$. Thus there is $\sigma \in \Sigma_{\ell}$ such that $C_i^* = \alpha C_i = \sigma C_i$ for each $1 \leq i \leq \ell$. For each $i$, $C_i^*$ and $C_{\sigma(i)}^*$ were chosen to be the unique smallest saturated fusion systems over $T_i$ and $T_{\sigma(i)}$ containing $C_i$ and $C_{\sigma(i)}$, respectively, that are realized by known finite quasisimple groups. Since $\sigma C_i^*$ is also realized by a known quasisimple group, we have $\sigma C_i^* = C_{\sigma(i)}^*$. Upon taking the direct product of these systems, it now follows that $\sigma C^* = C^*$. Hence $\alpha \in \text{Aut}(C^*)$, finishing the proof that $\text{Aut}(C) = \text{Aut}(C^*)$.

Now, $C = E(F)$ since $\text{Comp}(F) = \{C_1, \ldots, C_m\}$ by Proposition 4.9, and hence $C$ is characteristic in $F$ by Lemma 4.1(a). The Frattini condition for $C^* \leq \mathcal{F}$ holds since it holds for $C \subseteq \mathcal{F}$, and the extension condition holds since it holds for $\mathcal{E} \subseteq \mathcal{F}$. For each $\alpha \in \text{Aut}(F)$, $\alpha|_T \in \text{Aut}(C) = \text{Aut}(C^*)$ since $C$ is characteristic in $F$, and hence $\alpha C^* = C^*$. Thus the invariance condition holds (so $C^* \subseteq \mathcal{F}$), and $C^*$ is characteristic in $\mathcal{F}$. 

We need to understand the role played by the components of $G$ and of $\mathcal{F}_S(G)$ when determining automorphisms of the linking system $\mathcal{L}_S(G)$ and tameness. The next proposition is a first step towards that.

**Proposition 4.13.** Let $G$ be a finite $p'$-reduced $\mathcal{K}\mathcal{E}$-group, and assume Notation 4.8. Assume also that $O_p(G) = 1 = O_p(F)$. Thus for each $1 \leq i \leq k$, $L_i$ is a known simple group and $C_i$ is a simple fusion system. Set

$$L = L_1 \times \cdots \times L_k \leq G \quad \text{and} \quad T = T_1 \times \cdots \times T_k = S \cap L \in \text{Syl}_p(L);$$

and also $\mathcal{E} = F_T(L)$ and $C = O^{\sigma}(\mathcal{E})$.

(a) There is a unique minimal normal fusion subsystem $C^* \leq \mathcal{E}$ containing $C$ that is realized by a product of known finite simple groups. Also, $C^* = C_1^* \times \cdots \times C_k^*$, where for each $1 \leq i \leq k$, the subsystem $C_i^*$ is realized by a known finite simple group and $C_i \leq C_i^* \leq \mathcal{E}_i$.

(b) The fusion subsystems $C^*$ and $C$ are both centric and characteristic in $\mathcal{F}$.

**Proof.** (a) This is the special case of Proposition 4.12 when $O_p(G) = 1 = O_p(F)$. 

4.12 The subsystems $C$ and $C^*$ are characteristic in $\mathcal{F}$ by Proposition 4.12.

Since $O_p(\mathcal{F}) = 1 = O_p(G)$, each of the subsystems $C_i$ is simple, and hence $\text{Comp}(\mathcal{F}) = \{C_1, \ldots, C_\ell\}$ by Proposition 4.9. So $F^*(\mathcal{F}) = E(\mathcal{F}) = C$, and $C$ is centric in $\mathcal{F}$ by Lemma 4.1(b). So $C^* \geq C$ is also centric in $\mathcal{F}$.

We finish the section with two more specialized results. The first shows that in a saturated fusion system $\mathcal{F}$ where $E(\mathcal{F})$ is “almost realizable” in the sense that there is a minimal realizable fusion subsystem $C^* \leq \mathcal{F}$ with $O^{p'}(C^*) = E(\mathcal{F})$, the subsystem $C^*$ is always contained and normal in $\mathcal{F}$.

Lemma 4.14. Let $\mathcal{F}$ be a saturated fusion system over a finite $p$-group $S$. Let $C_1, \ldots, C_m$ be its components, where each $C_i \leq \mathcal{F}$ is a fusion system over $T_i \leq S$. Set $T = T_1 \cdots T_m$ and $C = C_1 \cdots C_m$. Set $Q = O_p(\mathcal{F})$.

Assume, for each $i = 1, \ldots, m$, that $C_i^* \leq \mathcal{F}$ is a saturated fusion subsystem over $T_i$ containing $C_i$ such that $C_i = O^{p'}(C_i^*)$, such that $C^*_i$ is realized by a known finite quasisimple group, and such that $C^*_i = C_i$ for each $i$ such that $C_i$ is realized by a known finite quasisimple group. Assume also that the subsystems $C_1^*, \ldots, C_m^*$ commute in $\mathcal{F}$, and that their central product $C^* = C_1^* \cdots C_m^*$ is normal in $\mathcal{F}$. Then $C^*$ is contained in $C_F(Q)$, and is normal in $C_F(Q)$ and in $N_F^{\text{Inn}(Q)}(Q)$.

Proof. Assume that the indices are chosen so that for some $0 \leq \ell \leq m$, $C_i^* = C_i$ for each $1 \leq i \leq \ell$ and $C_i^* > C_i$ for each $\ell + 1 \leq i \leq m$. For each $1 \leq i \leq m$, let $L_i$ be a known finite quasisimple group with $T_i \in \text{Syl}_p(L_i)$ such that $C_i^* = F_{T_i}(L_i)$ (there is such a group by assumption). By Theorem 4.5 applied to $L_i$, we are in case (d) of the theorem whenever $i \leq \ell$ and in case (c) whenever $i > \ell + 1$. (Case (b) cannot occur since we assume $C_i = O^{p'}(C_i^*) = C_i^*$ whenever $C_i$ is realizable by a known finite quasisimple group.) In particular, the $C_i$ and $L_i$ are all simple for $\ell + 1 \leq i \leq m$ by Theorem 4.5(c).

Set

$$C_\ell = C_1 \cdots C_\ell = C_\ell^* \cdots C_\ell^*, \quad C_{1\ell} = C_{\ell+1} \cdots C_m, \quad \text{and} \quad C_{1\ell}^* = C_{\ell+1}^* \cdots C_m^*,$$

and also $T_\ell = T_1 \cdots T_\ell$ and $T_{1\ell} = T_{\ell+1} \cdots T_m$. Since $C_i$ is simple for $i \geq \ell + 1$, we have

$$Z(C_{1\ell}) = 1, \quad C = C_\ell \times C_{1\ell}, \quad C^* = C_\ell^* \times C_{1\ell}^*, \quad \text{and} \quad T = T_\ell \times T_{1\ell}.$$

By [A2, 9.9] or [CH, Theorem 7.10(e)], we have $C \leq C_F(Q)$. By the Frattini condition for $C \leq C^*$, the fusion system $C^*$ is generated by $C$ and automorphisms $\alpha \in \text{Aut}_{C^*}(T)$ of order prime to $p$ that are the identity on $T_i$. By the extension condition for $C^* \leq \mathcal{F}$, each such $\alpha$ extends to an element $[\overline{\alpha}] \in \text{Aut}_F(TC_S(T))$ such that $[\overline{\alpha}, C_S(T)] \leq Z(T)$, and since $Q \leq F$, this implies that $[\overline{\alpha}, Q] \leq Q \cap Z(T) = Z(C) \leq T_i$. Upon replacing $\overline{\alpha}$ by $\overline{\alpha}^k$ for some appropriate $k$, we can arrange that $\alpha$ have order prime to $p$. Then

$$Q = C_Q(\overline{\alpha})[\overline{\alpha}, Q] \leq C_Q(\overline{\alpha})T_i \leq C_Q F(\overline{\alpha})$$

(see [G, Theorem 5.3.5] for the first equality), and so $\overline{\alpha}|_Q = \text{Id}_Q$. Thus $\alpha$ is a morphism in $C_F(Q)$, finishing the proof that $C^* \leq C_F(Q)$.

It remains to prove that $C^*$ is normal in $C_F(Q)$ and in $N_F^{\text{Inn}(Q)}(Q)$. The Frattini condition holds since it holds for $C \leq C_F(Q)$ and $C \leq N_F^{\text{Inn}(Q)}(Q)$, and the invariance condition holds for both inclusions since it holds for $C^* \leq \mathcal{F}$. We just showed that $C^*$ is generated by morphisms in $C$ and morphisms $\alpha \in \text{Aut}_{C^*}(T)$ that extend to $\overline{\alpha} \in \text{Aut}_F(TC_S(T))$ such that $\overline{\alpha}|_Q = \text{Id}_Q$ and $[\overline{\alpha}, C_S(T)] \leq Z(T)$, and hence the extension condition holds for both inclusions since $C \leq C_F(Q)$ and $\mathcal{C} \leq N_F^{\text{Inn}(Q)}(Q)$. \qed
In the following proposition, we show that each saturated fusion system $\mathcal{F}$ has a maximal characteristic subsystem that normalizes all components of $\mathcal{F}$.

**Proposition 4.15.** Let $\mathcal{F}$ be a saturated fusion system over a finite group $S$. Let $C_1, \ldots, C_k$ be the components of $\mathcal{F}$, where $C_i$ is a fusion system over $U_i$. Assume, for each $1 \leq i \leq k$, that $Z(C_i) = 1$ (i.e., that $C_i$ is simple). Set

$$U = U_1 \times \cdots \times U_k \leq S, \quad N = \bigcap_{i=1}^k N_S(U_i),$$

$$\mathcal{H} = \{ P \leq N \mid P \cap U_i \neq 1 \text{ for each } 1 \leq i \leq k \},$$

and

$$\mathcal{N} = \langle \varphi \in \text{Hom}_\mathcal{F}(P, Q) \mid P, Q \in \mathcal{H}, \varphi(P \cap U_i) \leq Q \cap U_i \text{ for each } 1 \leq i \leq k \rangle_{\mathcal{N}}.$$

Thus $E(\mathcal{F})$ is the direct product of the $C_i$, and is a fusion subsystem over $U$ by Lemma 4.1(a). Then the fusion subsystem $\mathcal{N}$ is saturated and characteristic in $\mathcal{F}$, $E(\mathcal{F}) \trianglelefteq \mathcal{N}$, and $C_i \trianglelefteq \mathcal{N}$ for each $1 \leq i \leq k$.

**Proof.** By Lemma 4.1(a) and since $Z(C_i) = 1$ for each $i$, $E(\mathcal{F})$ is the direct product of the $C_i$ and is characteristic in $\mathcal{F}$. In particular, $E(\mathcal{F}) \leq \mathcal{F}$, and $U$ is strongly closed in $\mathcal{F}$.

Set

$$\Delta = \{ \delta \in \Sigma_k \mid \exists \alpha \in \text{Aut}_\mathcal{F}(U) \text{ such that } \alpha(U_i) = U_{\delta(i)} \forall 1 \leq i \leq k \}.$$

We first claim that

$$\varphi(P \cap U_i) \leq U_{\delta(i)} \text{ for all } 1 \leq i \leq k. \quad (4.5)$$

It suffices to prove this when $P \leq U$ (hence $\varphi(P) \leq U$). Since $E(\mathcal{F}) \leq \mathcal{F}$ by Lemma 4.1(a), the Frattini condition implies that $\varphi = \alpha \varphi'$ for some $\alpha \in \text{Aut}_\mathcal{F}(U)$ and some $\varphi' \in \text{Hom}_\mathcal{F}(P, U)$. Since $\alpha$ permutes the components of $\mathcal{F}$, there is $\delta \in \Delta$ such that $\alpha(U_i) = U_{\delta(i)}$ for each $i$. Since $\varphi'$ is in $E(\mathcal{F})$, we have $\varphi(P \cap U_i) \leq \alpha(U_i) = U_{\delta(i)}$ for each $1 \leq i \leq k$.

We next claim that

$$\text{for each } \delta \in \Delta, \exists \alpha \in \text{Aut}_\mathcal{F}(N) \text{ such that } \alpha(U_i) = U_{\delta(i)} \text{ for each } 1 \leq i \leq k. \quad (4.6)$$

To see this, fix $\delta \in \Delta$, and choose $\beta \in \text{Aut}_\mathcal{F}(U)$ such that $\beta(U_i) = U_{\delta(i)}$ for each $1 \leq i \leq k$. Since $\text{Aut}_S(U) \leq \text{Syl}_p(\text{Aut}_\mathcal{F}(U))$ and $\text{Aut}_\mathcal{N}(U) \leq \text{Aut}_\mathcal{F}(U)$, we have that $\text{Aut}_\mathcal{N}(U)$ and $\beta \text{Aut}_\mathcal{N}(U)$ are both Sylow $p$-subgroups of $\text{Aut}_\mathcal{N}(U)$. So there is $\gamma \in \text{Aut}_\mathcal{N}(U)$ such that $\gamma \beta$ normalizes $\text{Aut}_\mathcal{N}(U)$, and hence by the extension axiom extends to $\alpha \in \text{Aut}_\mathcal{F}(N)$. By construction, $\alpha(U_i) = U_{\delta(i)}$ for each $1 \leq i \leq k$.

Fix $\alpha \in \text{Aut}_\mathcal{F}(N)$, and let $\delta \in \Sigma_k$ be such that $\alpha(U_i) = U_{\delta(i)}$ for all $1 \leq i \leq k$. For each $P, Q \in \mathcal{H}$ and $\varphi \in \text{Hom}_\mathcal{N}(P, Q)$, $\varphi(P \cap U_i) \leq Q \cap U_i$ for each $1 \leq i \leq k$, and hence $\alpha \varphi \alpha^{-1}(\alpha(P) \cap U_i) \leq \alpha(Q) \cap U_i$ for each $1 \leq i \leq k$. Thus $\alpha \varphi \in \text{Mor}(\mathcal{N})$. So $\alpha$ normalizes the subsystem $\mathcal{N}$, and we have shown

$$\text{for all } \alpha \in \text{Aut}_\mathcal{F}(N), \quad \alpha \mathcal{N} = \mathcal{N}. \quad (4.7)$$

We show in Step 1 that $\mathcal{N}$ is saturated, in Step 2 that $\mathcal{N}$ is characteristic, and in Step 3 that $E(\mathcal{F}) \trianglelefteq \mathcal{N}$ and $C_i \trianglelefteq \mathcal{N}$ for $1 \leq i \leq k$.

**Step 1:** For each $1 \leq i \leq k$, since $U_i \trianglelefteq N$, we have $Z(N) \cap U_i \neq 1$. So for each $P \in \mathcal{N}^c$, we have $P \cap U_i \geq Z(N) \cap U_i \neq 1$ for each $1 \leq i \leq k$, and hence $P \in \mathcal{H}$. Thus $\mathcal{N}^c \subseteq \mathcal{H}$.

By definition, $\mathcal{N}$ is $\mathcal{H}$-generated. So by [AKO, Theorem I.3.10], to prove that $\mathcal{N}$ is saturated, it suffices to prove that it is $\mathcal{H}$-saturated; i.e., that each $P \in \mathcal{H}$ is $\mathcal{N}$-conjugate to a subgroup that is fully automized and receptive in $\mathcal{N}$ (see [AKO, Definition I.3.9]).
If $P \in \mathcal{H}$ is receptive in $\mathcal{F}$ and $\varphi \in \text{Iso}_\mathcal{F}(Q,P)$ for some $Q \leq N$, then $\varphi$ extends to some $\overline{\varphi} \in \text{Hom}_\mathcal{F}(N^\mathcal{F}_\varphi,S)$, and $\overline{\varphi}(N^\mathcal{F}_\varphi \cap U_i) \leq U_i$ for each $1 \leq i \leq k$ by (4.5). Hence $\overline{\varphi}$ restricts to an element of $\text{Hom}_\mathcal{N}(N^\mathcal{N}_\varphi,N)$. Thus $P$ is receptive in $\mathcal{N}$.

Assume $P \in \mathcal{H}$ is fully automized in $\mathcal{F}$. By (4.5), each $\beta \in \text{Aut}_\mathcal{F}(P)$ permutes the subgroups $P \cap U_i$ for $1 \leq i \leq k$, while $\beta \in \text{Aut}_\mathcal{N}(P)$ if and only if it sends each $P \cap U_i$ to itself. So $\text{Aut}_\mathcal{N}(P)$ is normal in $\text{Aut}_\mathcal{F}(P)$. Also, $\text{Aut}_\mathcal{N}(P) = \text{Aut}_S(P) \cap \text{Aut}_\mathcal{N}(P)$: if $c_x \in \text{Aut}_\mathcal{N}(P)$ for $x \in N_S(P)$, then $(P \cap U_i) \leq U_i$ for each $1 \leq i \leq k$ and hence $x \in N$. So $\text{Aut}_\mathcal{N}(P) \subseteq \text{Syl}_p(\text{Aut}_\mathcal{N}(P))$ since $\text{Aut}_S(P) \subseteq \text{Syl}_p(\text{Aut}_\mathcal{F}(P))$, and we conclude that $P$ is fully automized in $\mathcal{N}$.

Now fix $P \in \mathcal{H}$, and let $\chi \in \text{Hom}_\mathcal{F}(P,N)$ be such that $\chi(P)$ is fully normalized in $\mathcal{F}$. Then $\chi(P) \in \mathcal{H}$, and we just showed that $\chi(P)$ is fully automized and receptive in $\mathcal{N}$. By (4.5) and (4.6), there is $\alpha \in \text{Aut}_\mathcal{F}(N)$ such that $\alpha \chi \in \text{Hom}_\mathcal{N}(P,N)$. Since $\mathcal{N} = \mathcal{N}'$ by (4.7), the subgroup $\alpha \chi(P)$ is also fully automized and receptive in $\mathcal{N}$, and is $\mathcal{N}$-conjugate to $P$. Since $P \in \mathcal{H}$ was arbitrary, this proves that $\mathcal{N}$ is $\mathcal{H}$-saturated, and finishes the proof that it is saturated.

**Step 2:** We first check that $N$ is strongly closed in $\mathcal{F}$. Set

$$K = \{ \alpha \in \text{Aut}_\mathcal{F}(U) \mid \alpha(U_i) = U_i, \text{ all } 1 \leq i \leq k \} \leq \text{Aut}_\mathcal{F}(U).$$

Thus $N = N_S^K(U)$. Let $x, y \in S$ be such that $x \in N$ and $y \in x^S$; we claim that $y \in N$.

Let $P, Q \leq S$ and $\varphi \in \text{Hom}_\mathcal{F}(P,Q)$ be such that $x \in P$, $y \in Q$, and $\varphi(x) = y$. Then $\varphi(P \cap U) \leq Q \cap U$ since $U$ is strongly closed in $\mathcal{F}$ as noted above, and so $\varphi$ induces a homomorphism $\overline{\varphi}$ from $PU/U \cong P/(P \cap U)$ to $QU/U \cong Q/(Q \cap U)$. By a theorem of Puig (see [Cr, Theorem 5.14]), $\overline{\varphi} \in \text{Hom}_{PU/U}(PU/U, QU/U)$. In other words, there is $\psi \in \text{Hom}_\mathcal{F}(PU, QU)$ such that for each $g \in P$, $\psi(g) \in \varphi(g)U$.

Now, $c_{\varphi(x)} = (\psi(U)|_U)c_{\varphi(U)}(\psi(U))^{-1}$ where $\psi(U) \in \text{Aut}_\mathcal{F}(U)$. Also, $c_x \in K$ since $x \in N = N_S^K(U)$, and $K$ is normal in $\text{Aut}_\mathcal{F}(U)$ since each $\alpha \in \text{Aut}_\mathcal{F}(U)$ permutes the $U_i$. So $c_{\varphi(x)} \in K$, and hence $\psi(x) \in N$. Hence $y = \psi(x)U \subseteq N$, finishing the proof that $N$ is strongly closed.

If $x \in C_S(N) \leq C_S(U)$, then $U_i = U_i$ for each $1 \leq i \leq k$ (hence for each $1 \leq i \leq k$), and so $x \in N$. Thus $C_S(N) \leq N$, so the extension condition holds for $\mathcal{N} \leq \mathcal{F}$.

By (4.5) and (4.6), for each $P, Q \leq S$ and $\varphi \in \text{Hom}_\mathcal{F}(P,Q)$, there is $\delta \in \Delta$ such that $\varphi(P \cap U_i) \leq Q \cap U_{\delta(i)}$ for all $1 \leq i \leq k$, and $\alpha \in \text{Aut}_\mathcal{F}(N)$ such that $\alpha(U_i) = U_{\delta(i)}$ for each $1 \leq i \leq k$. So $\alpha^{-1}\varphi \in \text{Hom}_\mathcal{N}(P, \alpha^{-1}(Q))$, and the Frattini condition for normality holds. The invariance condition holds by (4.7), and thus $\mathcal{N} \leq \mathcal{F}$.

For each $\beta \in \text{Aut}(\mathcal{F})$, $\beta$ permutes the components of $\mathcal{F}$, and hence permutes the subgroups $U_i$ and the members of the set $\mathcal{H}$. So $\mathcal{N} = \mathcal{N}'$ by the above definition of $\mathcal{N}$, and $\mathcal{N}$ is characteristic in $\mathcal{F}$.

**Step 3:** By [A2, 9.8.3] and since $\mathcal{N} \leq \mathcal{F}$, we have $E(\mathcal{F}) = E(\mathcal{N}) \leq \mathcal{N}$. For each $1 \leq i \leq k$, we have $C_i \leq E(\mathcal{F})$ by [A2, 9.8.2], and $c_{\alpha}(C_i) = C_i$ for each $\alpha \in \text{Aut}_\mathcal{N}(U)$ by definition of $\mathcal{N}$. So $C_i \leq \mathcal{N}$ by Lemma 2.4.

By construction, $\mathcal{N}$ is the largest saturated subsystem of $\mathcal{F}$ that contains each of the $C_i$ for $1 \leq i \leq k$ as a normal subsystem.

5. TAMENESS OF REALIZABLE FUSION SYSTEMS

We are now ready to show that realizable fusion systems are tame, assuming the classification of finite simple groups. This has already been shown in earlier papers for fusion systems

of known simple groups (see Proposition 5.2). When $\mathcal{F}$ is the fusion system of an arbitrary finite $p'$-reduced $\mathcal{K}\mathcal{C}$-group $G$, we will show that it is tame via a series of reductions based on an examination of the components of $G$.

We first restrict attention to tameness of fusion systems of finite simple groups. This was shown in most cases in earlier papers, and will be summarized below, but there were two cases whose proofs assumed earlier results that were in error:

**Lemma 5.1.** Let $(G, p)$ be one of the pairs (He, 3) or $(C_{01}, 5)$, choose $S \in \text{Syl}_{p}(G)$, and set $\mathcal{F} = \mathcal{F}_{S}(G)$ and $\mathcal{L} = \mathcal{L}_{S}^{c}(G)$. Then $\text{Out}(\mathcal{L}) = 1$, and so $\mathcal{F}$ is tamely realized by $G$.

**Proof.** Since $p$ is odd, $\text{Out}(\mathcal{F}) \cong \text{Out}(\mathcal{L})$ in both cases. The simplest proof of this is given in [O1, Theorem C] (and the sporadic groups are handled in Proposition 4.4 of that paper). A more general result is shown in [O3, Theorem C] and [GLn1, Theorem 1.1].

When $G = \text{He}$ and $p = 3$, the argument in [O5, p. 139] claimed (wrongly) that $\mathcal{F}$ is simple, but did not actually use this. Since $S$ is extraspecial of order 27 and exponent 3 and $\text{Out}_{G}(S) \cong D_{8}$, we have

$$D_{8} \cong \text{Out}_{G}(S) \leq \text{Aut}(\mathcal{F})/\text{Inn}(S) \leq N_{\text{Out}(S)}(\text{Out}_{G}(S)) \cong SD_{16}.$$ 

Elements in $N_{\text{Out}(S)}(\text{Out}_{G}(S)) \setminus \text{Out}_{G}(S)$ exchange subgroups of $S$ of order 9 with non-isomorphic automizers, and hence do not normalize $\mathcal{F}$. So $\text{Aut}(\mathcal{F}) = \text{Aut}_{G}(S)$, and $\text{Out}(\mathcal{F}) = 1$.

When $G = C_{01}$ and $p = 5$, the proof that $\text{Out}(\mathcal{F}) = 1$ in [O5, p. 138] used the incorrect claim that $\mathcal{F}$ has a normal subsystem of index 2. So we replace that argument with the following. By [Cu, Theorem 5.1] and the correction in [W, p. 145], $S$ contains a unique elementary abelian subgroup $Q$ of order 5\(^{3}\) and index 5, and $N_{G}(Q)/Q \cong \text{Aut}_{G}(Q) \cong C_{4} \times \Sigma_{5}$. Set $H = N_{G}(Q)$. By [O5, Lemma 1.2(b)] and since $C_{H}(Q) = Q$, we have $|\text{Out}(\mathcal{F})| \leq |\text{Out}(H)|$. By [OV, Lemma 1.2], there is an exact sequence

$$0 \longrightarrow H^{1}(H/Q; Q) \longrightarrow \text{Out}(H) \longrightarrow N_{\text{Out}(Q)}(\text{Out}_{H}(Q))/\text{Out}_{H}(Q),$$

and by [Be2, p. 110], there is a 5-term exact sequence for the homology of $H/Q$ as an extension of $C_{4}$ by $\Sigma_{5}$ that begins with

$$0 \longrightarrow H^{1}(\Sigma_{5}; H^{0}(C_{4}; Q)) \longrightarrow H^{1}(H/Q; Q) \longrightarrow H^{0}(\Sigma_{5}; H^{1}(C_{4}; Q)).$$

Since $H^{0}(C_{4}; Q) = H^{1}(C_{4}; Q) = 0$ ($C_{4}$ acts on $Q \cong C_{5} \times C_{5} \times C_{5}$ via multiplication by scalars), this proves that $H^{1}(H/Q; Q) = 0$. Also,

$$N_{\text{Out}(Q)}(\text{Out}_{H}(Q))/\text{Out}_{H}(Q) \cong N_{\text{GL}_{4}(5)}(C_{4} \times \Sigma_{5})/(C_{4} \times \Sigma_{5})$$

is trivial since $\text{GL}_{3}(5) \cong C_{4} \times \text{PSL}_{3}(5)$ and $\text{GO}_{3}(5) \cong \Sigma_{5}$ is a maximal subgroup of $\text{PSL}_{3}(5)$ (see, e.g., [GLS3, Theorem 6.5.3]). So $\text{Out}(\mathcal{F}) = \text{Out}(H) = 1$. □

We now summarize what we need to know here about tameness of fusion systems of finite simple groups.

**Proposition 5.2.** Fix a known simple group $G$, choose $S \in \text{Syl}_{p}(G)$, and assume that $S \notin \mathcal{F}_{S}(G)$. Then $\mathcal{F}_{S}(G)$ is tamely realized by some known simple group $G'$.

**Proof.** Set $\mathcal{F} = \mathcal{F}_{S}(G)$ and $\mathcal{L} = \mathcal{L}_{S}^{c}(G)$ for short. Note that $G$ is nonabelian since $S \notin \mathcal{F}_{S}(G)$.

Assume first that $G \cong A_{n}$ for some $n \geq 5$. By [AOV, Proposition 4.8], if $p = 2$ and $n \geq 8$ or if $p$ is odd and $p^{2} \leq n \equiv 0, 1$ (mod $p$), then $\kappa_{G}$ is an isomorphism. If $p$ is odd and $p^{2} < n \equiv k$ (mod $p$) where $2 \leq k \leq p - 1$, then $\mathcal{F}$ is still tamely realized by $A_{n}$: $\text{Out}(\mathcal{L}) = 1$ since $\mathcal{F}$ is isomorphic to the fusion system of $\Sigma_{n}$ and also that of $\Sigma_{n-k}$. If $p = 2$ and $n = 6, 7,$
then $\mathcal{F}$ is tamely realized by $A_6 \cong PSL_2(9)$ (and $\kappa_{A_6}$ is an isomorphism). In all other cases, $S$ is abelian and hence $S \leq \mathcal{F}$.

If $G$ is of Lie type in defining characteristic $p$, or if $p = 2$ and $G \cong 2F_4(2)'$, then by [BMO, Theorems A and D], $\kappa_G$ is an isomorphism except when $p = 2$ and $G \cong SL_3(2)$. In this exceptional case, $\mathcal{F}$ is tamely realized by $A_6$ again.

If $G$ is of Lie type in defining characteristic $q_0$ for some prime $q_0 \neq p$, then by [BMO, Theorem B], $\mathcal{F}$ is tamely realized by some other simple group $G^*$ of Lie type. See also Tables 0.1–0.3 in [BMO] for a list of which groups of Lie type do tamely realize their fusion system, and when they do not, which other groups they can be replaced by.

If $G$ is a sporadic simple group (and $S \not\subseteq \mathcal{F}$), then by [O5, Theorem A] and Lemma 5.1, $\kappa_G$ is an isomorphism except when $(G, p)$ is one of the pairs $(M_{11}, 2)$ or $(He, 3)$. If $(G, p) = (He, 3)$, then by the same theorem, $|\text{Out}(G)| = 2$ and $\text{Out}(\mathcal{L}) = 1$, so $\mathcal{F}$ is still tamely realized by $G$. If $(G, p) = (M_{11}, 2)$, then $\mathcal{F}$ is the unique simple fusion system over $SD_{16}$, and is tamely realized by $G^* = PSU_3(5)$ (and $\kappa_{G^*}$ is an isomorphism) by [AOV, Proposition 4.4].

The statements in the next proposition are very similar to results proven in [AOV], but except for part (a) are not stated there explicitly. Their proof consists mostly of repeating those arguments. Since many of the results referred to in [AOV, §2] require considering linking systems that are not centric, they depend in a crucial way on [AOV, Lemma 1.17], which states that $\text{Out}(\mathcal{L}_0) \cong \text{Out}(\mathcal{L})$ whenever $\mathcal{L}_0 \leq \mathcal{L}$ are linking systems associated to the same fusion system $\mathcal{F}$ and $\text{Ob}(\mathcal{L}_0) \subseteq \text{Ob}(\mathcal{L})$ are both $\text{Aut}(\mathcal{F})$-invariant.

**Proposition 5.3.** Let $\mathcal{F}$ be a saturated fusion system over a finite $p$-group $S$.

(a) If $\mathcal{F}/Z(\mathcal{F})$ is tamely realized by the finite $p'$-reduced $\mathcal{H}'c$-group $\overline{G}$, then $\mathcal{F}$ is tamely realized by a finite $p'$-reduced $\mathcal{H}'c$-group $G$ such that $G/Z(G) \cong \overline{G}$.

(b) Assume $\mathcal{F}_0 \trianglelefteq \mathcal{F}$ is a characteristic subsystem over $S_0 \trianglelefteq S$, with the property that $\mathcal{F}_0^{cr} \subseteq \mathcal{F}^c$. If $\mathcal{F}_0$ is tamely realized by a finite $p'$-reduced $\mathcal{H}'c$-group $G_0$, then $\mathcal{F}$ is tamely realized by a finite $p'$-reduced $\mathcal{H}'c$-group $G$ such that $G_0 \leq G$.

(c) If $\mathcal{F}_0 \trianglelefteq \mathcal{F}$ is a characteristic subsystem of index prime to $p$, and $\mathcal{F}_0$ is tamely realized by a finite $p'$-reduced $\mathcal{H}'c$-group $G_0$, then $\mathcal{F}$ is tamely realized by a finite $p'$-reduced $\mathcal{H}'c$-group $G$ such that $G_0 \trianglelefteq G$.

(d) If $\mathcal{F}_0 \trianglelefteq \mathcal{F}$ is a characteristic subsystem of $p$-power index, $\mathcal{F}_0$ is tamely realized by a finite $p'$-reduced $\mathcal{H}'c$-group $G_0$, and $Z(\mathcal{F}) = 1$, then $\mathcal{F}$ is tamely realized by a finite $p'$-reduced $\mathcal{H}'c$-group $G$ such that $G_0 \trianglelefteq G$.

**Proof.** (a) Assume $\mathcal{F}/Z(\mathcal{F})$ is tamely realized by a finite $p'$-reduced $\mathcal{H}'c$-group $\overline{G}$. Then $Z(\overline{G}) = Z(\mathcal{F}/Z(\mathcal{F}))$ by Proposition 4.11. So by [AOV, Proposition 2.18], $\mathcal{F}$ is tamely realized by a finite $p'$-reduced group $G$ such that $G/Z(G) \cong \overline{G}$. For each component $C$ of $G$, the subgroup $CZ(G)/Z(G) \cong C/(Z(C) \cap Z(G))$ is a component of $\overline{G}$, and so $G$ is also a $\mathcal{H}'c$-group.

(b) Assume $\mathcal{F}_0 \trianglelefteq \mathcal{F}$ is characteristic over $S_0 \trianglelefteq S$ with $\mathcal{F}_0^{cr} \subseteq \mathcal{F}^c$. Let $\mathcal{H}_0$ be the set of all $P \in \mathcal{F}^c$ such that $P \leq S_0$, and let $\mathcal{H}$ be the set of all $P \leq S$ such that $P \cap S_0 \in \mathcal{H}_0$. For each $P \in \mathcal{H}$, $P \cap S_0 \leq \mathcal{F}^c$ by assumption, and hence $P \in \mathcal{F}^c$. Thus $\mathcal{H} \subseteq \mathcal{F}^c$, and $\mathcal{F}_0^{cr} \subseteq \mathcal{H}_0$ since $\mathcal{F}_0^{cr} \subseteq \mathcal{F}^c$. So by [AOV, Lemma 1.30] and the existence of a centric linking system associated to $\mathcal{F}$ (Theorem 1.9), there is a normal pair of linking systems $\mathcal{L}_0 \leq \mathcal{L}$ associated
to $\mathcal{F}_0 \leq \mathcal{F}$ with object sets $\mathcal{H}_0$ and $\mathcal{H}$. Furthermore,

$$C_{\text{Aut}_\mathcal{L}(S_0)}(\mathcal{L}_0) = \delta_{S_0}(C_S(\mathcal{L}_0)) \leq \delta_{S_0}(C_S(\mathcal{F}_0)) \leq \delta_{S_0}(C_S(S_0)) \leq \delta_{S_0}(S_0) \leq \text{Aut}_{\mathcal{L}_0}(S_0) :$$

the equality and first inequality by Lemma 2.11(a), the third inequality since $S_0 \in \mathcal{F}^{cr}_0 \subseteq \mathcal{F}^c$, and the other two by definition. So $\mathcal{L}_0$ is centric in $\mathcal{L}$.

Assume $\mathcal{F}_0$ is tamely realized by a finite $p'$-reduced $\mathcal{K}\mathcal{G}\mathcal{L}$-group $G_0$ with $S_0 \in \text{Syl}_p(G_0)$. By Proposition 4.11, we have $Z(G_0) = Z(\mathcal{F}_0)$. Then $\mathcal{L}_0 \cong \mathcal{L}^0_{\mathcal{S}_0}(G_0)$ (the full subcategory of $\mathcal{L}_0(\mathcal{G}_0)$ with objects the set $\mathcal{H}_0$) by the uniqueness of linking systems. By definition, the sets of objects $\mathcal{H}_0$ and $\mathcal{H}$ are invariant under the actions of $\text{Aut}(\mathcal{F}_0)$ and $\text{Aut}(\mathcal{F})$, respectively. Also, $\mathcal{L}_0$ is $\text{Aut}(\mathcal{L})$-invariant, since $\mathcal{F}_0$ is characteristic in $\mathcal{F}$, and $\mathcal{L}_0 = \pi^{-1}(\mathcal{F}_0)$ by [AOV, Lemma 1.30] (where $\pi: \mathcal{L} \rightarrow \mathcal{F}$ is the structure functor for $\mathcal{L}$). All hypotheses in [AOV, Proposition 2.16] are thus satisfied, and so $\mathcal{F}$ is tamely realized by some finite group $G$ such that $G_0 \leq G$ and $G/G_0 \cong \text{Aut}_{\mathcal{L}_0}(S_0)/\text{Aut}_{\mathcal{L}_0}(S_0)$.

By the Frattini argument, $G = G_0N_G(S_0)$, and hence

$$N_G(S_0)/N_{G_0}(S_0) \cong G/G_0 \cong \text{Aut}_\mathcal{L}(S_0)/\text{Aut}_{\mathcal{L}_0}(S_0).$$

Since $\text{Aut}_\mathcal{L}(S_0) = N_G(S_0)/O^p(C_G(S_0))$ and similarly for $\mathcal{L}_0$, this proves that $O^p(C_G(S_0)) = O^p(C_{G_0}(S_0))$. Also,

$$C_{G_0}(S_0) = Z(S_0) \times O^p(C_{G_0}(S_0)) \quad \text{and} \quad C_G(S_0) = Z(S_0) \times O^p(C_G(S_0)):$$

the last equality since $S_0 \in \mathcal{F}_0^{cr} \subseteq \mathcal{F}^c$. So $C_{G_0}(S_0) = C_{G_0}(S_0) \leq G_0$. In particular, since $[O_{p'}(G_0), G_0] \leq O_{p'}(G_0) = 1$, this implies that $O_{p'}(G_0) \leq C_{G_0}(S_0) \leq C_{G}(S_0) \leq C_{G}(G_0) = G_0$. So $O_{p'}(G_0) \leq O_{p'}(G_0) = 1$, and hence $G$ is $p'$-reduced.

If $C$ is a component of $G$, then $G_0 \leq G$, either $C$ is a component of $G_0$ or $[C, G_0] = 1$ (see [A1, 31.4] or [AKO, Lemma A.12]). Since $C_{G}(G_0) \leq C_{G}(S_0) \leq G_0$, and since all components of $G$ contained in $G_0$ are normal in $G_0$ and hence in $\text{Comp}(G_0)$, this shows that $\text{Comp}(G) \subseteq \text{Comp}(G_0)$, and hence that $G$ is also a $\mathcal{K}\mathcal{G}\mathcal{L}$-group.

(c) By [AKO, Lemma 1.7.6(a)], we have $\mathcal{F}_0^c = \mathcal{F}^c$. (See also Definition 1.14(c).) Hence (c) is a special case of (b).

(d) Assume $\mathcal{F}_0$ has $p$-power index in $\mathcal{F}$ and $Z(\mathcal{F}) = 1$. By [BCGLO, Proposition 3.8(b)], a subgroup $P \leq S_0$ is $\mathcal{F}$-quasicentric if and only if it is $\mathcal{F}_0$-quasicentric. Let $\mathcal{H}$ be the set of all $P \leq S$ such that $P \cap S_0$ is $\mathcal{F}_0$-quasicentric. Then $\mathcal{H} \subseteq \mathcal{F}^q$ since overgroups of quasicentric subgroups are quasicentric, and $\mathcal{H} \supseteq \mathcal{F}^c$ by [AOV, Lemma 1.20(d)]. By Theorem 1.9, there is a unique linking system $\mathcal{L}$ associated to $\mathcal{F}$ with $\text{Ob}(\mathcal{L}) = \mathcal{H}$, and by [BCGLO, Theorem 4.4], there is a unique linking system $\mathcal{L}_0 \leq \mathcal{L}$ associated to $\mathcal{F}_0$ with $\text{Ob}(\mathcal{L}_0) = (\mathcal{F}_0)^q$. Then $\mathcal{L}_0 \leq \mathcal{L}$: the condition on objects (Definition 1.12(a)) holds by construction, and the invariance condition (1.12(b)) holds by the uniqueness of $\mathcal{L}_0$.

By Lemma 2.11(c), there is an action of $\mathcal{L}/\mathcal{L}_0$ on $C_S(\mathcal{L}_0)$ such that $C_{C_S(\mathcal{L}_0)}(\mathcal{L}/\mathcal{L}_0) = Z(\mathcal{F})$, where $Z(\mathcal{F}) = 1$ by assumption. Also, $\mathcal{L}/\mathcal{L}_0 = \text{Aut}_\mathcal{L}(S_0)/\text{Aut}_{\mathcal{L}_0}(S_0)$ is a $p$-group since $\mathcal{F}_0$ has $p$-power index in $\mathcal{F}$, so $C_{S}(\mathcal{L}_0) = 1$. Hence $Z(\mathcal{F}_0) = 1$ and $C_{\text{Aut}_\mathcal{L}(S_0)}(\mathcal{L}_0) = 1$ by Lemma 2.11(a), and in particular, $\mathcal{L}_0$ is centric in $\mathcal{L}$.

If in addition, $\mathcal{F}_0$ is characteristic in $\mathcal{F}$, then each $\alpha \in \text{Aut}(\mathcal{L})$ induces an element $\beta = \tilde{\mu}_\mathcal{L}(\alpha) \in \text{Aut}(\mathcal{F})$ (Definition 2.7), and $c_\beta(\mathcal{F}_0) = \mathcal{F}_0$ by assumption. Hence $\alpha(\mathcal{L}_0) = \mathcal{L}_0$ by Proposition 2.6 and the uniqueness of the linking systems in [BCGLO, Theorem 4.4]. Also, by construction, $\text{Ob}(\mathcal{L}_0)$ and $\text{Ob}(\mathcal{L})$ are invariant under the actions of $\text{Aut}(\mathcal{F}_0)$ and $\text{Aut}(\mathcal{F})$.

Assume $\mathcal{F}_0$ is tamely realized by a finite $p'$-reduced $\mathcal{K}\mathcal{G}\mathcal{L}$-group $G_0$. By Proposition 4.11, we have $Z(G_0) = Z(\mathcal{F}_0)$. By Theorem 1.9 (the uniqueness of centric linking systems), $\mathcal{L}_0 \cong \mathcal{L}^0_{\mathcal{S}_0}(G_0)$. The hypotheses of [AOV, Proposition 2.16] thus hold, and so $\mathcal{F}$ is tamely
realized by some group $G$ such that $G_0 \trianglelefteq G$ and $G/G_0 \cong \text{Aut}_\mathcal{C}(S_0)/\text{Aut}_{\mathcal{C}_0}(S_0)$. In particular, $G/G_0$ is a $p$-group, so all components of $G$ are in $G_0$, and $\text{Comp}(G) = \text{Comp}(G_0)$. Also, $O_{p'}(G) = O_{p'}(G_0) = 1$, and so $G$ is a $p'$-reduced $\mathcal{K}'\mathcal{C}'$-group. \hfill $\square$

We are now ready to prove our main theorem. As explained in the introduction, Theorem 5.4, as well as Theorems 5.5 and 5.6, have been formulated so that their proofs are independent of the classification of finite simple groups.

Recall that by Lemma 4.2(b,c), the condition $\text{Comp}(\mathcal{E}) = \text{Comp}(\mathcal{F})$ in the statement of Theorem 5.4 is satisfied whenever $\mathcal{E}$ is centric in $\mathcal{F}$, and these two conditions are in fact equivalent if $O_p(\mathcal{F}) = 1$.

**Theorem 5.4.** Let $\mathcal{E} \trianglelefteq \mathcal{F}$ be a normal pair of fusion systems over $T \trianglelefteq S$ such that $\text{Comp}(\mathcal{E}) = \text{Comp}(\mathcal{F})$. Assume that $\mathcal{E}$ is realized by a finite $p'$-reduced group all of whose components are known quasisimple groups. Then $\mathcal{F}$ is tamely realized by a finite $p'$-reduced group all of whose components are known quasisimple groups.

**Proof.** Let $\mathcal{I}$ be the set of all triples $(\mathcal{F}, \mathcal{E}, H)$ such that

- $\mathcal{E} \trianglelefteq \mathcal{F}$ are saturated fusion systems over finite $p$-groups $T \trianglelefteq S$ such that $\text{Comp}(\mathcal{E}) = \text{Comp}(\mathcal{F})$;
- $H$ is a $p'$-reduced $\mathcal{K}'\mathcal{C}'$-group such that $T \in \text{Syl}_p(H)$ and $\mathcal{E} = \mathcal{F}_T(H)$; and
- $\mathcal{F}$ is not tamely realized by any finite $p'$-reduced $\mathcal{K}'\mathcal{C}'$-group.

Assume the theorem does not hold; i.e., that $\mathcal{I} \neq \emptyset$. Let $(\mathcal{F}, \mathcal{E}, H) \in \mathcal{I}$ be such that $|\text{Mor}(\mathcal{E})|, |\text{Mor}(\mathcal{F})| \in \mathbb{N}^2$ is the smallest possible under the lexicographic ordering. In other words, there are no triples $(\mathcal{F}^*, \mathcal{E}^*, H^*)$ in $\mathcal{I}$ where $|\text{Mor}(\mathcal{E}^*)| < |\text{Mor}(\mathcal{E})|$; and among those where $|\text{Mor}(\mathcal{E}^*)| = |\text{Mor}(\mathcal{E})|$, there are none where $|\text{Mor}(\mathcal{F}^*)| < |\text{Mor}(\mathcal{F})|$.

We show in Step 1 that $O_p(\mathcal{F}) = 1$, and that $H$ can be chosen to be a product of known finite simple groups. We then show in Step 2 that the components of $\mathcal{F}$ are all normal in $\mathcal{F}$, and reduce this to a contradiction in Step 3.

**Step 1:** Let $L_1, \ldots, L_k$ be the components of $H$, and set $U_i = T \cap L_i \in \text{Syl}_p(L_i)$. Set $D_i = \mathcal{F}_{U_i}(L_i)$ and $C_i = O_{p'}(D_i)$ for each $i$. Assume that the $L_i$ are ordered so that for some $m$, $C_i$ is quasisimple if and only if $i \leq m$. We are thus in the situation of Proposition 4.9, with $H$, $T$, $U_i$, and $D_i$ in the roles of $G$, $S$, $T_i$, and $E_i$. So $\text{Comp}(\mathcal{F}) = \text{Comp}(\mathcal{E}) = \{C_1, \ldots, C_m\}$ by that proposition.

Set $U = U_1 \cdots U_m$ and $\mathcal{E}_0 = \mathcal{F}_U(L_1 \cdots L_m) \leq \mathcal{E}$. By Proposition 4.12(a), there is a unique minimal subsystem $C^* \leq \mathcal{E}_0$ over $U$ containing $O_{p'}(\mathcal{E}_0)$ that is realized by a $p'$-reduced $\mathcal{K}'\mathcal{C}'$-group, and $C^*$ is realized by a central product $H_0$ of known finite $p'$-reduced quasisimple groups. By Proposition 4.12(b), $C^*$ is characteristic in $\mathcal{E}$ and hence normal in $\mathcal{F}$. Hence $(\mathcal{F}, C^*, H_0) \in \mathcal{I}$, so $\mathcal{E} = C^*$ by the minimality of $|\text{Mor}(\mathcal{E})|$, and we can take $H = H_0$. In particular, $m = k$, and $H$ is a central product of known finite $p'$-reduced quasisimple groups.

Set $Q = O_p(\mathcal{F})$, and set $S_0 = \Lambda^{\text{Inn}(Q)}(Q) = QC_S(Q)$ and $\mathcal{F}_0 = N^{\text{Inn}(Q)}_\mathcal{F}(Q)$. Thus $\mathcal{F}_0$ is a fusion subsystem over $S_0$. Since $Q^{\mathcal{F}} = \{Q\}$, the subgroup $Q$ is fully Inn($Q$)-normalized in $\mathcal{F}$ and hence $\mathcal{F}_0$ is saturated (see Definition I.5.1 and Theorem I.5.5 in [AKO]). Also, $\mathcal{F}_0$ is weakly normal in $\mathcal{F}$ by [AOV, Proposition 1.25(c)], and is normal since $C_S(S_0) \leq S_0$ (the extension condition holds). For each $\alpha \in \text{Aut}(\mathcal{F})$, $\alpha(Q) = Q$, so $c_\alpha(\mathcal{F}_0) = \mathcal{F}_0$, and hence $\mathcal{F}_0$ is characteristic in $\mathcal{F}$.
If $P \in \mathcal{F}_0^c$, then $P \geq Q$ since $Q \subseteq \mathcal{F}_0$ (see [AKO, Proposition I.4.5(a⇒b)]). So for each $P^* \in \mathcal{F}^c$, $P^* \geq Q$, and $C_S(P^*) \leq C_S(Q) \leq S_0$. Thus $C_S(P^*) = C_{S_0}(P^*) \leq P^*$ since $P^* \in \mathcal{F}_0^c$, so $P \in \mathcal{F}^c$. Thus $\mathcal{F}_0^c \subseteq \mathcal{F}^c$.

By Proposition 5.3(b) and since $\mathcal{F}$ is not tamely realized by any $p'$-reduced $\mathcal{K}^*$-group, the subsystem $\mathcal{F}_0$ is not tamely realized by any $p'$-reduced $\mathcal{K}^*$-group. Also, $\mathcal{E} \leq N_{\mathcal{F}}^\text{inn}(Q) = \mathcal{F}_0$ by Lemma 4.14 (with $\mathcal{E}$ in the role of $C^*$). Thus $(\mathcal{F}_0, \mathcal{E}, H) \in \mathcal{I}$, and by the minimality assumption, we have $\mathcal{F} = \mathcal{F}_0$. So $\mathcal{F}_0$ is a $p'$-reduced $\mathcal{K}^*$-group either.

For each $P, R \leq C_S(Q)$ and each $\varphi \in \text{Hom}_{\mathcal{F}}(P, R)$, the morphism $\varphi$ extends to some $\overline{\varphi} \in \text{Hom}_{\mathcal{F}}(PQ, RQ)$ since $Q \leq \mathcal{F}$, and $\varphi|_Q = c_g|_Q$ for some $g \in Q$ since $\text{Aut}_{\mathcal{F}}(Q) = \text{Inn}(Q)$. Hence $c_g^{-1}\overline{\varphi}|_P = \varphi$ since $c_g|_{C_S(Q)} = \text{Id}$. Thus each morphism in $\mathcal{F}$ between subgroups of $C_S(Q)$ lies in $C_{\mathcal{F}}(Q)$, and so $\mathcal{F}/Q \cong C_{\mathcal{F}}(Q)/Z(Q)$ by Lemma 1.22, applied with $C_{\mathcal{F}}(Q)$ in the role of $\mathcal{E}$.

Set $Z = Z(Q)$. We have now shown that $C_{\mathcal{F}}(Q)/Z$ is not realized by any $p'$-reduced $\mathcal{K}^*$-group. Also, $\mathcal{E} \leq C_{\mathcal{F}}(Q)$ by Lemma 4.14 (applied with $\mathcal{E}$ in the role of $C^*$), so $Z\mathcal{E} \leq C_{\mathcal{F}}(Q)$ by Lemma 1.21, and $Z\mathcal{E}/Z \leq C_{\mathcal{F}}(Q)/Z$ by Lemma 1.18. By Lemma 1.22, $Z\mathcal{E}/Z \cong \mathcal{E}/(Z \cap T)$, where $\mathcal{E}/(Z \cap T)$ is realized by $H/(Z \cap T)$ (see [Cr, Theorem 5.20]). So $Z\mathcal{E}/Z$ is realized by a $p'$-reduced $\mathcal{K}^*$-group $H_0 \cong H/(Z \cap T)$. Also,

$$\text{Comp}(Z\mathcal{E}/Z) = \{ZC_1/Z, \ldots, ZC_k/Z\} = \text{Comp}(C_{\mathcal{F}}(Q)/Z)$$

by Lemma 4.3. So $(C_{\mathcal{F}}(Q)/Z, Z\mathcal{E}/Z, H_0) \in \mathcal{I}$, and by the minimality assumption on $(\mathcal{F}, \mathcal{E}, H)$, we have $\mathcal{E} \cong Z\mathcal{E}/Z$ and $\mathcal{F} \cong C_{\mathcal{F}}(Q)/Z(Q)$ and thus $O_p(\mathcal{F}) = Q = 1$.

To summarize, we have reduced to the case where $(\mathcal{F}, \mathcal{E}, H) \in \mathcal{I}$ satisfies:

$$O_p(\mathcal{F}) = O_p(\mathcal{E}) = 1, \mathcal{E} = C_{\mathcal{F}}(H) \text{ where } H = L_1 \times \cdots \times L_k, \text{ and each } L_i$$

is a known finite simple group. Also, $\text{Comp}(\mathcal{F}) = \text{Comp}(\mathcal{E}) = \{C_1, \ldots, C_k\}$

where $T = U_1 \times \cdots \times U_k$, $U_i \in \text{Syl}_p(L_i)$, and $C_i = O^{p'}(\mathcal{F}_i(L_i))$.

**Step 2:** Let $\mathcal{N} \leq \mathcal{F}$ be the characteristic subsystem constructed in Proposition 4.15: a subsystem over $N = \bigcap_{i=1}^k N_S(U_i)$ normal in $\mathcal{F}$ and containing each component $C_i$ as a normal subsystem. In particular, for each $\alpha \in \text{Aut}_{\mathcal{N}}(T)$, $\alpha(U_i) = U_i$ for all $1 \leq i \leq k$.

For each $P \in \mathcal{N}^c$ and each $Q \in \mathcal{P}^c$, $Q \in \mathcal{N}^c$ since $\mathcal{N} \leq \mathcal{F}$, and so $Q \geq Z(N)$. For each $1 \leq i \leq k$, we have $U_i \leq N$ by definition of $N$, and hence $Q \cap U_i \neq 1$. Each $x \in C_S(Q)$ centralizes each $Q \cap U_i$ and hence normalizes each subgroup $U_i$ (recall that each element of $S$ permutes the $U_i$). So $C_S(Q) = C_N(Q) \leq Q$, and $P \in \mathcal{F}^c$. Thus $\mathcal{N}^c \subseteq \mathcal{F}^c$. By Proposition 5.3(b) and since $\mathcal{F}$ is not tamely realized by a $p'$-reduced $\mathcal{K}^*$-group, $\mathcal{N}$ is not tamely realized by a $p'$-reduced $\mathcal{K}^*$-group either.

Now, $\mathcal{E}$ is weakly normal in $\mathcal{N}$ by [Cr, Proposition 8.17] and since $\mathcal{E} \leq \mathcal{F}$ and $\mathcal{N} \leq \mathcal{F}$. By the definition of $\mathcal{N}$ in Proposition 4.15, if $T \leq P \leq N$, and $\alpha \in \text{Aut}_{\mathcal{F}}(P)$ is such that $\alpha|_T \in \text{Aut}_{\mathcal{N}}(T)$, then $\alpha \in \text{Aut}_{\mathcal{N}}(P)$. So the extension condition for $\mathcal{E} \leq \mathcal{N}$ follows from that for $\mathcal{E} \leq \mathcal{F}$, and hence $\mathcal{E} \leq \mathcal{N}$. 

Thus \((\mathcal{N}, \mathcal{E}, H) \in \mathcal{S}\), and \(\mathcal{F} = \mathcal{N}\) by the minimality assumption. In other words, \((\mathcal{F}, \mathcal{E}, H) \in \mathcal{S}\) satisfies:

\[
(5.1) \quad \text{holds, and } \mathcal{C}_i \leq \mathcal{F} \text{ for each } 1 \leq i \leq k.
\]

**Step 3:** Set \(\mathcal{C} = E(\mathcal{F}) = C_1 \times \cdots \times C_k\). By Proposition 4.13 (applied with \(H\) and \(\mathcal{E}\) in the roles of \(G\) and \(\mathcal{F}\)), there is a unique minimal normal fusion subsystem \(\mathcal{C}^* = C_1^* \times \cdots \times C_k^* \leq \mathcal{E}\) containing \(\mathcal{C}\) that is realized by a product of known finite simple groups. Furthermore (by the same proposition), \(\mathcal{C} = O^{\prime\prime}(\mathcal{C}^*), \mathcal{C}^*\) is centric and characteristic in \(\mathcal{E}\), and for each \(i\),

- \(\mathcal{C}_i \leq \mathcal{C}_i^* \leq \mathcal{F}_{U_i}(L_i)\),
- \(\mathcal{C}_i = O^{\prime\prime}(\mathcal{C}_i^*)\), and
- \(\mathcal{C}_i^* = \mathcal{F}_{U_i}(H_i^*)\) where \(H_i^*\) is a known finite simple group.

Then \(\mathcal{C}^* \leq \mathcal{F}_T(H) = \mathcal{E} \leq \mathcal{F}\), and so \(\mathcal{C}^* \leq \mathcal{F}\) by Lemma 2.4 and since \(\mathcal{C}^*\) is characteristic in \(\mathcal{E}\). Set \(H^* = H_1^* \times \cdots \times H_k^*\), so that \(\mathcal{C}^* = \mathcal{F}_T(H^*)\). Thus \((\mathcal{F}, \mathcal{C}^*, H^*) \in \mathcal{S}\), and \(\mathcal{E} = \mathcal{C}^*\) by the minimality assumption.

Let \(\text{Aut}^0(\mathcal{C}^*) \leq \text{Aut}(\mathcal{C}^*)\) be the subgroup of all automorphisms that send each \(U_i\) to itself. Then \(\text{Aut}_{\mathcal{F}}(T) \leq \text{Aut}^0(\mathcal{C}^*)\) by (5.2) and since \(\mathcal{C}^* \leq \mathcal{F}\). Each factor \(\mathcal{C}_i^*\) is a full subcategory of \(\mathcal{C}^*\) (contains all morphisms in \(\mathcal{C}^*\) between subgroups of \(U_i\)), and hence each \(\alpha \in \text{Aut}^0(\mathcal{C}^*)\) sends each \(\mathcal{C}_i^*\) to itself. So

\[
\text{Aut}_{\mathcal{F}}(T)/\text{Aut}_{\mathcal{C}^*}(T) \leq \text{Aut}^0(\mathcal{C}^*)/\text{Aut}_{\mathcal{C}^*}(T) \cong \prod_{i=1}^{k} \text{Out}(\mathcal{C}_i^*).
\]

By assumption, each \(\mathcal{C}_i^*\) is realized by a known finite simple group, hence is tamely realized by a known finite simple group by Proposition 5.2. Since \(\text{Out}(K)\) is solvable for each known finite simple group \(K\) (see [GLS3, Theorem 7.1.1(a)]), the groups \(\text{Out}(\mathcal{C}_i^*)\) are also solvable. So \(\text{Aut}_{\mathcal{F}}(T)/\text{Aut}_{\mathcal{C}^*}(T)\) is solvable.

The hypotheses of [O4c, Theorem 5(b)] thus hold for the pair \(\mathcal{C}^* \leq \mathcal{F}\). By that theorem, there is a sequence \(\mathcal{C}^* = \mathcal{F}_0 \leq \mathcal{F}_1 \leq \cdots \leq \mathcal{F}_m = \mathcal{F}\) of saturated fusion subsystems, for some \(m \geq 0\), such that

(i) for each \(0 \leq j < m\), \(\mathcal{F}_j\) is normal of \(p\)-power index or index prime to \(p\) in \(\mathcal{F}_{j+1}\) and \(\mathcal{C}^* \leq \mathcal{F}_j \leq \mathcal{F}\); and

(ii) for each \(1 \leq j \leq m\) and each \(\alpha \in \text{Aut}(\mathcal{F}_j)\) with \(c_\alpha(\mathcal{C}^*) = \mathcal{C}^*\), we have \(c_\alpha(\mathcal{F}_{j'}) = \mathcal{F}_{j'}\) for all \(0 \leq j' < j\).

Recall that \(\text{Comp}(\mathcal{F}) = \{\mathcal{C}_1, \ldots, \mathcal{C}_k\}\). For each \(0 \leq j \leq m - 1\), \(\text{Comp}(\mathcal{F}_j) \subseteq \text{Comp}(\mathcal{F})\) since \(\mathcal{F}_j \leq \mathcal{F}\), and the opposite inclusion holds since \(\mathcal{C}_i \leq \mathcal{C} \leq \mathcal{C}^* \leq \mathcal{F}_j\) for each \(i\). Hence \(\mathcal{C}\) is characteristic in \(\mathcal{F}_j\). For each \(\alpha \in \text{Aut}(\mathcal{F}_j), \alpha|_{T} \in \text{Aut}(\mathcal{C})\) since \(\mathcal{C}\) is characteristic, and \(\text{Aut}(\mathcal{C}) = \text{Aut}(\mathcal{C}^*)\) by Proposition 4.12(a). So \(c_\alpha(\mathcal{C}^*) = \mathcal{C}^*\), and hence \(c_\alpha(\mathcal{F}_{j'}) = \mathcal{F}_{j'}\) for all \(0 < j' < j\) by condition (ii) above.

In particular, this shows that \(\mathcal{F}_j\) is characteristic in \(\mathcal{F}_{j+1}\) for each \(j\). Also, \(Z(\mathcal{F}_j) \leq O_p(\mathcal{F}_j) = 1\) for each \(j\) by Lemma 2.3(b) and since \(O_p(\mathcal{F}) = 1\) and \(\mathcal{F}_j \leq \mathcal{F}\). So by Proposition 5.3(c,d), and since \(\mathcal{F}_j\) has index prime to \(p\) or \(p\)-power index in \(\mathcal{F}_{j+1}\) and \(Z(\mathcal{F}_j) = 1\), if \(\mathcal{F}_j\) is tamely realized by a finite \(p'\)-reduced \(K Che\)-group \(G_j\), then \(\mathcal{F}_{j+1}\) is tamely realized by a finite \(p'\)-reduced \(K Che\)-group \(G_{j+1} \geq G_j\).

For each \(1 \leq i \leq k\), \(\mathcal{C}_i^*\) is tamely realized by some known finite simple group by Proposition 5.2, and so \(\mathcal{C}^* = \mathcal{F}_0\) is tamely realized by a product of known finite simple groups by
Proposition 3.7(c). Hence $F_i$ is tamely realized by a $p'$-reduced $\mathcal{K}$-$\mathcal{E}$-group for each $1 \leq i \leq m$. This contradicts our assumption on $F = F_m$, and we conclude that $F = \emptyset$. 

Note that Theorem A is just Theorem 5.4 without mentioning tameness.

We now list some special cases of Theorem 5.4.

**Theorem 5.5.** Let $F$ be a saturated fusion system over a finite $p$-group $S$. If all components of $F$ are realized by known finite quasisimple groups, then $F$ is tamely realized by a finite $p'$-reduced group all of whose components are known quasisimple groups.

*Proof.* This is the special case of Theorem 5.4 where $\mathcal{E}$ is the generalized Fitting subsystem of $F$. Note that $\mathcal{E}$ is realizable since it is the central product of its components (which are realizable by assumption) and a $p$-group. 

Our third theorem is the special case of Theorem 5.4 where $\mathcal{E} = F$.

**Theorem 5.6.** Let $p$ be a prime, and let $F$ be a fusion system over a finite $p$-group that is realized by a finite $p'$-reduced group all of whose components are known quasisimple groups. Then $F$ is tamely realized by a finite $p'$-reduced group all of whose components are known quasisimple groups.
